DESCRIPTION: DHIS 2 platform was opted to and customized to client level data needs. Project indicators and tools for tracking HIV testing, treatment and retention services were harmonized and linked to the system. Unique identifier coding system was developed to link key population individuals across the cascade of services over time. A one month pilot of the system was implemented and data users were trained. Web and mobile system applications were set up at all service delivery points for data entry.

LESSONS LEARNED: The system simplified analysis. It improved efficiency of data management, data accuracy, and site-level monitoring by disaggregating high-risk KPs based on their age, client volume, exposure to gender-based violence, and condom-use practices. The system calculates information from multiple sources of data and de-duplicates to track individual level uptake of services in real time. Dashboards are generated weekly to provide performance feedback. Figure 1 shows the dashboard with results for enrolled clients.

[Figure 1]

CONCLUSIONS/NEXT STEPS: Application of the DHIS 2 tracker has led to improved efficiency in monitoring the outcomes of individual clients accessing services across the HIV continuum in a community-based program. Service providers and managers were able to access real-time data use for timely decision making.

PEE1682

USE OF FACILITY MISSED APPOINTMENT TRACKING TOOL TO IMPROVE RETENTION AMONG PATIENTS ON ANTIRETROVIRAL THERAPY IN KISUMU AND MIGORI COUNTIES, WESTERN KENYA

N. Odiyo[1], P. Nziwa[1], C. Bodo[2], I.D. Odhiambo[1], S. Abuga[1], B. Crandall[1], H. Alwang'a[1], D. Osiemo[1], L. Nguti[1], C. Bonde[1], B. Kanyango[1], P. Muia[1]
[1]PATH, Kisumu, Kenya, [2]Initiatives Inc., Kisumu, Kenya

BACKGROUND: Patient retention is the ability of comprehensive care clinics to maintain patient engagement in care and continuous antiretroviral therapy (ART) for overall health and transmission prevention. The USAID Afya Ziwani project developed a tool for early detection of ART defaulters and prompt tracking of their return to care to assist facility staff with improving long-term retention.

DESCRIPTION: The facility missed appointment tracking tool (FMATT) was introduced in eight mid- and high-volume health facilities in Migori and Kisumu counties with low patient retention. Missed appointment data was captured in the FMATT for three months prior to and daily after introduction. Facility teams review the appointment diary daily and enter the missed appointments in FMATT. Then they use the tool to determine clients to trace and document as they return to care (also daily). At the beginning of each month, all patients not returned to care in the immediate previous month and prior months are recorded in FMATT for continued active tracing.

LESSONS LEARNED: From January to March 2019, 2,145 of 2,725 (78.7%) patients who missed appointments returned to care within the same month. From April to June 2019, 2,347 of 2,604 (90.1%) patients who missed appointments returned to care within the same month. An additional 146 patients were brought back to care the following month, improving retention to 95.7% (2,493). From April to June 2019, contribution of defaulters from the last week of the month was 49, while from January to March 2019, this was 190, which significantly reduces the number of patients facilities need to track.

CONCLUSIONS/NEXT STEPS: FMATT shows health care providers a running balance of patients who need to be returned to care and achievements in bringing patients back to care. It triggers prompt action to seek patients who miss appointments in the current month and continuous reminder of previous defaulters for continuous follow-up. It allows providers quick access to retention data without additional analysis promoting quick decision-making. The tool is now used at all project-supported facilities and was adopted by USAID to improve retention across other projects.

PEE1683

THE UTILIZATION OF THE THREE INTERLINKED ELECTRONIC REGISTER (TIER) IN MANAGING ANTIRETROVIRAL (ART) PATIENTS BY THE NURSING SERVICES MANAGERS (NSMS): A CASE STUDY OF THE ETHEKWINI MUNICIPALITY, DURBAN SOUTH AFRICA

T. Khubone[1], H. Ngobese[2], N. Gxagxisa[2]
[1]Ethekwini Municipality, Health, Kloof, South Africa, [2]Ethekwini Municipality, Durban, South Africa

BACKGROUND: South African government upscaling of ART resulted in many treatment sites unable to monitor large cohorts of patients using paper-based systems only. Another challenge was the lack of the required infrastructure and resources to implement a full electronic medical record (EMR) systems. This has resulted in the development of a 3-tier approach to monitoring which includes a paper-based system making up tier 1, an electronic version of the paper register as the middle tier or tier 2, and full electronic medical record software at the 3rd tier. EThekwini is home to 8% of South Africa's HIV epidemic with an estimated 650,000 people living with HIV. By December 2019, 466764 clients, 72%, were on ART out of the 585000 expected by December 2020. The aim of this assessment is to determine the utility of the Tier by the NSMs

DESCRIPTION: Mixed methods study design involving: Document Review; auditing the monthly Tier reports actioned by the NSMs from the year 2016, 2017 and 2018 in 30 municipal facilities and Qualitative in-depth interviews to 10 NSMs on their knowledge, usage, and perception of Tier.net; from September to December 2019.

LESSONS LEARNED: Interviewed NSMs revealed the usage of Tier to generate HIV patients reports, action them, it is the game-changer in managing HIV patients. Lack of onsite and technical support to the NSMs, inadequate involvement of clinicians, electricity load shedding, unfriendly Tier design features; linkage to other facilities were identified as barriers to adoption Tier.

Year	2016	2017	2018
Number of Clinics	26	26	26
Monthly Tier.net verification	8%	15%	52%

[Table 1: Document Review on the Monthly Tier Verification by the NSMs from 2016 to 2018]

CONCLUSIONS/NEXT STEPS: Tier usage by NSMs in managing HIV patients has significantly increased over the past 3 years (2016 to 2018) from 8% to 52%.

In-depth interviews with the NSMs revealed that the year 2019 has witnessed a great improvement in Tier data demand and use for ART patients and decision making.

Documentation by NSMs needs to be improved.

A bottom-up approach is required

Tier is indeed a solution long sought after to manage HIV patients

PEE1684

REDCAP: USING REAL-TIME, E-DATA COLLECTION TO IMPROVE LINKAGE TO CARE TO HIV SERVICES AFTER TESTING POSITIVE

G. Govender[1], A. Grimwood[1]
[1]Kheth'Impilo, Cape Town, South Africa

BACKGROUND: South Africa has made significant progress towards achieving the 90-90-90 goals, however challenges exist with HIV positive clients' not starting treatment or starting late after testing. A contributor is the lack of a reliable method to ensure clients testing positive are linked to treatment. REDCap, an electronic data capture and management system, has the ability to capture, store, link and act as a data warehouse for analysis, individual management and tracking and has been used to strengthen tracking of clients referred for clinical services.

DESCRIPTION: HIV testing, screening for STI's and TB and health education were carried out in the community by community healthcare workers (CHWs) across two districts in the Western Cape and Eastern Cape. Paper-based consent forms were used to document services rendered which was captured into REDCap. Between April to mid-May 2019, the REDCap Database was developed from form design to system testing. Data capturers (n=30) and CHWs (n= >100)

were trained on the system in May 2019 and subsequently the database was launched in June 2019. As of January 2020, the system houses over 100 000 records having been collected over a 6 month period. The database enabled the extraction of positive cases, to be checked against facility records to determine which positive cases were not linked to care so CHW's go into the community and trace these clients and link them to care. REDCap functionality also included the ability to monitor staff workload.

LESSONS LEARNED: The REDCap data warehouse enabled staff to monitor frequency of individual testing preventing use of time and resources on retesting the same clients within 3 month intervals. Turnaround time from receiving a positive test result to linkage to care has been substantially reduced due to the availability of real time data that allows for immediate action to reduce non-start of treatment and late presentation. Additionally staff workload monitoring allowed for better staff accountability and improved efficiency.

CONCLUSIONS/NEXT STEPS: Improved client management and service delivery was made possible by using REDCap, low-cost, networked system that is user-friendly and spans the cascade of data collection from entry to programmatic reports to facilitate linkage to care.

PEE1685

THERE IS AN "APP AND APPROACH" FOR THAT: INTEGRATING HUMAN-CENTERED DESIGN IN A MOBILE APP TO INCREASE UPTAKE OF VOLUNTARY MEDICAL MALE CIRCUMCISION AMONG ADULT MEN

P.D. Lubambi[1], K. Nyalali[1], L. Mphuru[1], C. Mejia[2], S. Aldridge[2], P. Masika[3], D. Simbeye[4]
[1]IntraHealth International, Dar es Salaam, Tanzania, United Republic of, [2]IntraHealth International, Chapel Hill, United States, [3]Tanzania Youths Alliance (TAYOA), Dar es Salaam, Tanzania, United Republic of, [4]US Centers for Disease Control and Prevention, Dar es Salaam, Tanzania, United Republic of

BACKGROUND: Male circumcision (MC) reduces men's risk of acquiring HIV infection through heterosexual exposure by approximately 60%. Since 2009, voluntary medical male circumcision (VMMC) has been a key HIV prevention intervention in Tanzania. While reaching men (aged 25+ years) with VMMC is challenging, MC in this age group has greater impact in reducing HIV incidence. Thus, innovative approaches are needed to increase uptake of VMMC services in this group.

DESCRIPTION: IntraHealth International leads the CDC-funded Tohara Plus project, which works to expand VMMC services in Tanzania. Since October 2018, IntraHealth has collaborated with the Tanzania Youth Alliance (TAYOA) to implement an approach that integrates human-centered design (HCD) and mobile technology through the "Tohara Journey" app to better understand men's concerns about their decision and action to access VMMC services.

Implemented in four regions of Tanzania, the approach started by training Popular Opinion Leaders (POLs) on HCD concepts and tools including the mobile app. POLs engage men aged 25+years in the community to identify their unique barriers to VMMC using the mobile app. This allows POLs to develop tailored messages for addressing barriers and facilitators to VMMC during interpersonal communication and through SMS texts.

338 POLs were trained on the approach, following uncircumcised men through their journeys and helping them move across barriers to accessing VMMC. The mobile app facilitates continued interaction by allowing users to respond to messages sent to them with more questions.

LESSONS LEARNED: POLs registered 38,132 individuals who were interested in VMMC with the Tohara Journey app. All 38,132 were provided with a set of 4-6 messages (a total of 121,846 SMS) addressing specific barriers. The project observed a 10% increase in the proportion of males circumcised aged 25+ years from 14% in 2017 to 24% in 2018.

CONCLUSIONS/NEXT STEPS: HCD using the mobile app has demonstrated effectiveness in increasing uptake of VMMC services among men aged 25+ years by addressing specific barriers that hinder them from getting circumcised. This approach makes communication with targeted populations more relevant and motivational and can be applied in other interventions to address individual barriers in utilizing services.

INNOVATIVE USES OF DATA TO STRENGTHEN SYSTEMS AND PROGRAMMES

PEE1686

USING PATIENT TASK ANALYSIS TO EXAMINE HARM REDUCTION AND HIV COMORBIDITY SERVICE DECENTRALIZATION IN VIETNAM

c. Lin[1], L. Li[2], A.T. Nguyen[3], A.T. Le[3]
[1]UCLA, NPI, Los Angeles, United States, [2]UCLA, Los Angeles, United States, [3]National Institute of Hygiene and Epidemiology, Hanoi, Vietnam

BACKGROUND: Vietnam is among the first countries to decentralize harm reduction and HIV care to community-based healthcare settings. In this study, we used task analysis to examine the process of methadone maintenance therapy (MMT) and comorbidity service decentralization from MMT patients' perspective.

METHODS: Twenty MMT patients were recruited from centralized MMT clinics in Thai Nguyen Province of Vietnam. The patients were encouraged to transfer their MMT services to a local community health center (CHC) and receive a one-time comorbidity screening and counseling from commune health workers (CHW). Well-trained interviewers conducted follow-up phone interviews with the patients once a week to document the detailed subtasks that they had to perform to receive services from CHC and the time taken. The challenges of each task were probed with open-ended questions.

RESULTS: The subtasks to service decentralization included discussing service transfer with the MMT provider in charge, submitting the application form, getting in contact with CHW, receiving urinalysis, receiving methadone dosage at CHC, discussing comorbidity issues with CHW, collect samples for comorbidity testing, and receiving corresponding treatment or referral. From the day of the initial discussion of service transfer, it took on average 28.8 days for the patients to receive the first MMT dosage from CHC. Among the ten patients who did not finish MMT service transfer in 30 days, the step caused the most delay was from submission of the application to the first contact with CHC. Fourteen (70%) of the patients completed the task of comorbidity counseling and testing within seven days of starting MMT at CHC. Four patients did not complete comorbidity counseling or testing at the end of the study, and reasons were CHW being unfriendly or financial difficulties to pay for HBV and tuberculosis testing. The major complaints were the CHC's layout being inappropriate for MMT distribution and CHW lacking knowledge about harm reduction.

CONCLUSIONS: Communication and collaboration between MMT clinics and CHC should be strengthened to ensure a seamless transaction of patients. More training should be provided for CHW not only to enhance their professional knowledge but also to address the stigmatizing attitude towards MMT patients.

PEE1687

HIV RECENT INFECTION SURVEILLANCE: HEALTHCARE WORKER ACCEPTABILITY AND FEASIBILITY OF INTEGRATING THE RAPID TEST FOR RECENT INFECTION INTO HIV TESTING SERVICES IN MALAWI, 2019

M. Arons[1], M. Msukwa[2], K. Curran[3], A. Ernst[4], G. O'Malley[4], G. Bello[2], D. Payne[5], J. Theu[2], E. Kim[5], T. Dobbs[1], B. Parekh[1], I. Namakhoma[2], V. Shanmugam[1], S. Gugsa[6]
[1]Centers for Disease Control and Prevention, Division of Global HIV and TB, Atlanta, United States, [2]International Training and Education Center for Health, Department of Global Health, University of Washington, Malawi, Lilongwe, Malawi, [3]Centers for Disease Control, Division of Global HIV and TB, Atlanta, United States, [4]University of California, Institute for Global Health Sciences, Global Strategic Information, San Francisco, United States, [5]Centers for Disease Control and Prevention, Lilongwe, Malawi, [6]International Training and Education Center for Health, Department of Global Health, University of Washington, Malawi, Seattle, United States

BACKGROUND: Malawi Ministry of Health implemented a new surveillance system to detect recent HIV infections using a rapid test for recent infection (RTRI) to effectively target HIV transmission. At 23 sites, healthcare workers (HCWs) were trained to conduct RTRI and prepare dried blood spot (DBS) for viral load (VL) testing for algorithm-driven recency results. We conducted a cross-sectional survey to explore the acceptability and feasibility of integrating this activity into HIV testing services (HTS).

METHODS: In September 2019, external research assistants interviewed HCWs using a semi-structured survey to capture experiences conducting RTRIs and integrating the activity within routine HTS.

We aimed to interview a minimum of 100 of 131 trained HCWs. Descriptive statistics were used to summarize closed-ended responses; thematic analysis was used to group open-ended text.

RESULTS: A total of 119 HCWs were interviewed representing all 23 sites; median age was 32 years and 53.0% were female. Most (68.3%) estimated spending ³20 additional minutes beyond routine HTS per client for this activity, with 35.3% of HCW reporting documentation and 29.5% reporting DBS preparation taking the most additional time. Overwhelmingly, HCWs perceived high client acceptability; 100% reported clients as 'somewhat' or 'very accepting'. In total, 82.4% of HCWs reported the RTRI was easy-to-use, while 86.6% reported the RTRI as 'the same' or 'easier' to use than routine HIV rapid diagnostic tests.

Themes from qualitative responses, included: perceiving the RTRI as an uncompensated additional task, wanting surveillance results and not knowing individual client benefit. While HCWs understood the importance of recent infection surveillance, they differed in attitude towards returning results to clients. Some believed returning individual results may enhance partner notification services or client's acceptance of their HIV diagnosis; others were concerned results may cause confusion or interpersonal violence.

CONCLUSIONS: This is the first study to assess HCW experiences using RTRIs for recent HIV infection surveillance. Overall, HCWs perceived RTRIs to be acceptable, easy-to-use, and valuable. The additional time may be substantial (>1 hour/day) at high-volume sites. Providing public health action plans or aggregated surveillance results to HCWs and/or clients may maintain motivation and support sustainability of this novel surveillance system.

PEE1688

MONITORING OF HEALTH SERVICE IMPROVEMENT: BUILDING A HEALTH QUALITY SYSTEM DRIVEN BY LHWS OR COUNSELORS

J. Tlale[1], R. Marima[1], M. Montebatsi[1], P. Memiah[2], N. Blanco[2], N. Ndwapi[1]
[1]Botswana University of Maryland School of Medicine Health Initiative (BUMMHI), Non-Governmental Organization, Gaborone, Botswana, [2]University of Maryland School of Medicine, Division of Epidemiology and Prevention, Baltimore, United States

BACKGROUND: Quality service delivery is imperative regardless of worldwide shortage of human resources for health (HRH), particularly in low and middle-income countries like Botswana. In spite of guidelines for HIV management, care provided continues to be substandard. One technical program manager (TPM) oversees remediation and administrative work for all the selected facilities in the district and they are often overstretched and report inability to follow and satisfy the monthly facility support schedule. The aim is to test if integration of lay health workers (LHWs) can alleviate HR constraints and improve service delivery.

DESCRIPTION: Using a quality improvement (QI) approach, Core Essential Elements (CEEs; defined as a set of tools used to score the assessment point's performance against an established standard) 2_03, 2_04, 2_13 of site improvement for monitoring system (SIMS) and three epidemic control indicators (linkage to treatment, viral load (VL) coverage, VL suppression) were monitored for six selected facilities in Tutume and Francistown districts from June to August 2019. The aim was to identify if collaboration with LHWs in alerting TPM of some key implementation gaps using a weekly SIMS-based service quality checklist (SQC) improved response time towards remediation and ultimately improved programme outcomes. Baseline data showed 50% (n=6) of facilities with CEEs scored below 70% considered poor, while only 17% of facilities scored above 80% considered good. Due to these results, a SQC comprising of key CEEs, that assess implementation of standard operational plans, guidelines and policies in HIV management, was developed for LHWs to monitor sites and submit weekly reports to the TPM.

LESSONS LEARNED: SIMS results post remediation revealed 100% of facilities had CEEs scored above 80% and 100% of facilities achieving over 90% of key epidermic control targets. On-site mentoring, training and collaboration with LHWs or counselors to improve quality of services can potentially result in achievement of epidermic control, improved health service delivery as well as increasing efficiency.

CONCLUSIONS/NEXT STEPS: The integration of LHWs into the health facility's QI system is cost efficient and sustainable and we plan to scale it up to institutionalize QI and optimize HR.

PEE1689

A SMARTPHONE-BASED LEARNING PLATFORM FOR HEALTHCARE PROVIDERS IN THE FIGHT AGAINST HIV/AIDS IN HENAN PROVINCE OF CHINA

X. Deng[1], J. Liu[1], Q. Zhao[1]
[1]*Henan Infectious Diseases Hospital, Zhengzhou, China*

BACKGROUND: In order to improve the health services to the HIV infected patients, a total of 1,008 anti-retroviral treatment (ART) facilities were set up in communities with 20 or more registered patients. Since this great number of facilities are scattered across a vast area, and the staff are of different professional levels, a new training solution is necessary to ensure the quality of ART services.

DESCRIPTION: We established a smartphone-based e-learning platform (SLP) for ART facility staff in Henan, where they can read articles, share clinical cases, and take courses and exams. SLP is built in as a mini-app of WeChat, the most widely used social app in China, so that the user can easily register, access all contents and functions on their mobile phones, and keep informed with latest news in this field. This platform is centrally managed, routinely updated, and user activities are recorded and analyzed to provide insights for future development.

LESSONS LEARNED: Six months after its launch, there are 672 registered HIV/AIDS related healthcare providers (HCPs) in the system. These users came from 469 facilities, covering 46.5% (469/1,008) of all ART facilities. 180 facilities have finished at least 1 training course. Considering that traditional training program can only cover about 100 centers in a year, SLP has boosted our training efficiency by more than 3-fold. The most popular categories are Guidelines and Consensus (145 courses, covering 57% of the users), Expert Columns (61 courses, 37%), Meeting Education Programs (17 courses, 36%) and Cases Sharing (93 courses, 26%).

[Figure. Smartphone-based e-Learning Platform @ Month 6]

CONCLUSIONS/NEXT STEPS: Online learning platform has greatly expanded our coverage and increased our efficiency of professional education for HIV/AIDS related HCPs. With collected data and feedbacks, we will adopt a data-driven approach to develop and deliver learning contents and programs that are dynamically tailored to HCP's needs.

PEE1690

ENRICHING THE QUALITY OF DATA USING CUSTOMIZED DATA CAPTURE TOOLS TO TRACK CLIENT OUTCOMES ON ART: A TASO RUKUNGIRI RETENTION STRATEGY

J. Bibohere[1], A. Beingana Borobya[2], P. Rwamugyema[2]
[1]*Uganda Management Institute, Management Science, Kampala, Uganda,*
[2]*Makerere University, Kampala, Uganda*

BACKGROUND: Retention on ART is a key indicator in HIV management that greatly impacts on the 2nd and 3rd 90 of UNAIDS strategy. Evidence based data driven processes key in HIV response retention interventions require tailor-made strategies to enable data collection and documentation of progress at facility level Faced with a problem of high rates of lost to follow up clients with undocumented specific outcomes arising from gaps in data collection tools, TASO Rukungiri developed a patient tracking and outcomes form to document outcomes clients missing appointment on ART so as to improve retention monitoring and reporting.

DESCRIPTION: A team composed of counselors, clinicians and M&E staff, developed a client follow form up and an electronic capture screen to document and track outcomes of clients who miss appointments and those lost on ART.

The form captures the clients current phone contact, service delivery model, dates of three follow up attempts, outcomes and findings such as client transferred to another health facility, relocated from the area and a narrative (comments).The form provides options for documenting plans made by after a follow up which include making another attempt, and initiating a physical follow up(home visit). These outcomes are captured for each follow up attempt done by the staff and presented for entry into a designed electronic data capture screen.

LESSONS LEARNED:

- 181 clients missing appointments between October-December 2018 were followed up using the client follow up form and outcomes documented:63(34%) clients were returned to care at the end of the Jan-March 2019.12 self-transferred, 50 relocated,15 promising to return to care and 41 clients could not be traced after 3 attempts.6months retention for clients newly initiated on ART improved from 80% in Jan-Mar 2019 to 90% in July-Sept 2019.Feedback from clients relocating and self-transferring guided the intensification of health talks with focus on seeking appropriate ART referral. Challenges of wrong phone contacts hindering follow up greatly reduced with the use of the form to capture updated contacts.

CONCLUSIONS/NEXT STEPS: The customized client follow up form and data entry screen greatly improves data use and quality of documentation hence it should be adopted to improve retention for clients on ART.

PEE1691

MAINSTREAMING KEY POPULATIONS PROGRAM REPORTING SYSTEM ONTO THE NATIONAL HEALTH REPORTING SYSTEM (DHIS2) A KENYAN EXPERIENCE

V. Amulega[1], H. Musyoki[1], J. Musimbi[1], P. Bhattacharjee[2], J. Kioko[2]
[1]Ministry of Health, Division National Aids and STI Control Program, Nairobi, Kenya, [2]PHDA, Division National Aids and STI Control Program, Nairobi, Kenya

BACKGROUND: A National Health Information System (HIS) plays an important role in ensuring that reliable health information is available for operational and strategic decision-making hence improving quality of life of people. Prior to 2018, there was fragmented Key population (KP) M&E tools and reporting systems leading to development of parallel data collection tools for implementing partners and Ministry of Health hence lack of standardization of reporting of Key Population program nationally hence inconsistent and unreliable Key Population data.

DESCRIPTION: The ministry of Health through NASCOP therefore led a process of revising and rolling out KP program data collection tools. It involved refining KP program goals, objectives and outcomes, defining KP program cascades for prevention and treatment, redefining data elements, indicators, reporting structure, agreeing on nomenclature of unique identifier code for the KP program, explore use of electronic records, developing summary reporting tool and enabling DHIS configuration for the KP program. The process looked at harmonizing field realities such as avoiding tool duplication, including new interventions like PrEP, Hepatitis B and C, looking at donor reporting requirements and reporting tools to align with the Kenya Health Information System (KHIS) for aggregate reporting. Several meetings and workshops were held involving the different stakeholders to have KP data and indicators included in the DHIS2 in the process sensitizing key government officials and stakeholders on KP.

LESSONS LEARNED: Government led processes are more acceptable and as a country been able to have indicators in the KHIS for "groups considered "criminalized". Inclusion of KP data in the KHIS has also seen the process of integration and streamlining of the program with other programs hence more acceptability of the population.

CONCLUSIONS/NEXT STEPS: Reporting rates for KP data has improved from 3% in 2017 to 54% in 2019 on KHIS. The TWG meetings will continues to advocate uptake of new information systems for KP programs and ensure reporting rates improve to 100%.

PEE1692

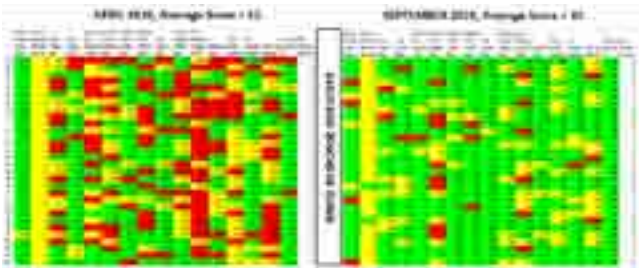
THE POWER OF SCORECARDS: IMPROVING THE QUALITY OF HIV SERVICE DELIVERY IN TANZANIA

R. van de Ven[1], F. Lyimo[1], G. Tesha[1], R. Lyimo[1], B. Kilama[1], J. Kalimunda[2]
[1]Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, United Republic of, [2]USAID Tanzania, Dar es Salaam, Tanzania, United Republic of

BACKGROUND: Achieving the UNAIDS 95-95-95 goals to improve the health of all people living with HIV and controlling the HIV epidemic requires focus on the quality of HIV prevention and treatment services delivered. The Elizabeth Glaser Pediatric AIDS Foundation initiated an enhanced site-level support initiative to improve site level performance at 30 high-volume facilities in Tanzania.

DESCRIPTION: As part of PEPFAR Tanzania efforts to prioritize performance at high-volume sites, a scorecard was designed for health providers to monitor 16 key performance indicators on a monthly basis. These indicators focused on eight program areas: optimized HIV testing, index testing, linkage case management, same-day ART initiation, early retention, multi-month dispensing, TB preventive therapy and viral load coverage and suppression. Monthly routine program data were used to create site-level scorecards. Each indicator was scored individually using a color-coded scale (green-yellow-red, based on set thresholds) and each given a weight to add to a composite score compiled on a 0-100 scale. Monthly trends were provided to health facilities to review and address performance gaps.

LESSONS LEARNED:



[Figure]

The performance trend was monitored from April to September 2019. Overall performance improved from a composite score of 52 in April to 82 in September (see figure). Monthly indicator monitoring, coupled with close follow-up through on-site mentorship and increased human resource support through interns and volunteers has helped improve the quality of services. The visualization of the score through a color scale provided a powerful snapshot, clearly highlighting performance gaps. It created site-level ownership of data, whereby health providers were keen to address "red" scores urgently.

CONCLUSIONS/NEXT STEPS: Further expansion of the scorecard is planned in terms of both site coverage and adding other program indicators. An automated process, with the use of digital health applications, could further strengthen the routine data use at the facility level and improve the quality of services.

PEE1693

USING SUPPLY CHAIN MANAGEMENT DATA TO ASSESS QUALITY OF HIV TESTING IN PRIVATE HEALTH FACILITIES IN UGANDA

B. Lubega Muhamed[1], F. Naamara[1], A. Muwanga[1], B. Basasibwaki[1], R. Settaala[1], E. Sebyatika[1], T. Kasule[1], S. Muyingo[1]
[1]Medical Access Uganda Limited, Kampala, Uganda

BACKGROUND: HIV testing is the linchpin of prevention and treatment. For people who test HIV positive, diagnosis opens the door to lifesaving treatment, reducing the risk of transmitting HIV to others. For those who test negative, knowing their status empowers them to remain HIV-free. We assessed the quality of HIV testing based on adherence to the national HIV testing algorithm, using data from LMIS reports.

DESCRIPTION: Data on Determine (Screening test), Stat-Pak (Confirmatory test) and SD Bioline (Tie breaker test) were retrieved from bimonthly consumption reports from health facilities between April 2017 and September 2019. Consumption data were used to estimate consumption of Determine, Stat-Pak and SD-Bioline using a ratio of

100:10:3 respectively. The estimates were compared with the actual consumption that were reported from the health facilities. Correlations, T-tests and principal component analysis were used to compare actual reported consumption with estimates generated using the ratio of 100:10:3 Results were stratified by level of care (Special clinic, Hospital, HC IV and HC III).

LESSONS LEARNED: There were strong correlations between actual consumption and estimated consumption using the ratio (Determine r= 0.776, p<0.0001; Stat-Pak r=0.77, p<0.0001 and SD Bio line r=0.814, p<0.0001). Principal component analysis showed strong relationship between Determine, Stat-Pak and SD Bio line with 90.20% variance explained at eigen value of 2.706. Correlations were lower at HC III (Determine r= 0.78, p<0.0001; Stat-Pak r=0.78, p<0.0001 and SD Bioline r=0.58, p<0.0001), increasing with subsequent increase in the level of care - Hospitals (Determine r= 0.88, p<0.0001; Stat-Pak r=0.88, p<0.0001 and SD Bioline r=0.92, p<0.0001).

CONCLUSIONS/NEXT STEPS: Consumption/LMIS data is often more consistent and readily available. These findings underscore the important and complementary role consumption data can play in assessing quality of HIV testing. The low correlations observed at HC IIIs imply that they should be prioritized for support supervision to improve quality of HIV testing.

PEE1694

REACHING THE FIRST 90: EARLY RESULTS OF IMPLEMENTATION OF A NATIONAL VOLUNTARY ASSISTED PARTNER NOTIFICATION PROGRAM TO INCREASE HIV CASE FINDING IN RURAL MALAWI

T.A. Tembo[1], K.R. Simon[1,2], C. Chikoti[1], W. Kammera[1], S. Kawonga[1], A. Ng'ambi[1], P. Mkambeni[3], N.E. Rosenberg[4,5], M.H. Kim[1,2]
[1]Baylor College of Medicine Children's Foundation, Lilongwe, Malawi, [2]Baylor College of Medicine, Department of Pediatrics, Houston, United States, [3]Malawi Ministry of Health, Lilongwe, Malawi, [4]University of North Carolina Project, Lilongwe, Malawi, [5]University of North Carolina, Department of Health Behavior, Chapel Hill, United States

BACKGROUND: Voluntary assisted partner notification (VAPN) involves healthcare providers (HCP) offering HIV-positive persons (index cases) assistance with recruitment and HIV testing of contacts (sexual partners). VAPN has been shown to be effective in increasing identification of HIV-positive individuals in research settings and is endorsed by the World Health Organization. However, data demonstrating the impact of VAPN on index testing in routine program settings in rural Africa is limited. In early 2019, Malawi began implementing VAPN as a routine part of national HIV testing services (HTS). We conducted a pre/post evaluation to assess changes in index testing indicators before and after implementation of VAPN in rural Malawi.

METHODS: In July 2019, VAPN implementation began at 36 health facilities in Mangochi, district (HIV prevalence 10.1%) following a two-day lay HCP training. Prior to VAPN, only passive referral (where index clients recruit their contacts for HTS without HCP support) was occurring. The training included didactics on the rationale and benefits of VAPN as well as role plays allowing HCWs to practice offering VAPN as a choice to patients. Routine facility-level data were abstracted from clinical registers pre VAPN implementation (January-June 2019) and post (July-December 2019). We conducted a pre/post evaluation to assess changes in the mean number of index clients screened for index case testing and mean number of contacts elicited (paired t-test) as well as proportion of and yield of contacts tested (Chi-square test).

RESULTS: Post VAPN implementation, mean number of index clients screened per facility-month increased (pre=12.0, post=38.2, p<0.001), mean number of contacts elicited also increased (pre= 7.4, post=19.4, p<0.001), and proportion of contacts returning for HTS increased (pre=35%, post=46%, p=0.03). The percentage of contacts diagnosed HIV-positive decreased (pre=35%, post=29%, p=0.21). Post-implementation, 68% of index clients with contacts chose VAPN over passive methods. In the post period 71% (972/1361) of all HTS for sexual partners was through VAPN.

CONCLUSIONS: VAPN implementation using lay HCP in a rural setting improved various outcomes along the index case testing cascade. However, HIV testing yield decreased and not all contacts reported for testing. Therefore, other strategies are required to increase the proportion of contacts returning for HTS.

PEE1695

SUSTAINING HIGH PERFORMANCE: USE OF A PREVENTION OF MOTHER TO CHILD HIV TRANSMISSION (PMTCT) SELF-ASSESSMENT TOOL TO IMPROVE FACILITY PERFORMANCE IN PHALOMBE DISTRICT, MALAWI

J. Nkhonjera[1], C. Stillson[2], A. Tallmadge[2], G. Nyirenda[2]
[1]Ministry of Health - Phalombe District Hospital, Nursing, Blantyre, Malawi, [2]Clinton Health Access Intiative (CHAI), Lilongwe, Malawi

BACKGROUND: Beginning in 2016, Malawi began conducting quarterly PMTCT mentorships at the district-level. During the first year of mentorship, Phalombe district registered significant improvement in its PMTCT indicators, becoming one of the highest performing districts in the country. Due to this success, Phalombe graduated from the mentorship programme in 2017. In order to sustain this high performance, the Phalombe District Health Office developed a facility PMTCT Self-Assessment Tool (PSAT). The tool was designed to guide facilities in collecting data from existing registers to measure their performance for 13 programme indicators each month. In this way, facilities could monitor their own progress outside of national mentorship visits and identify key areas for improvement through the development of facility-specific action.

DESCRIPTION: All 15 public health facilities in Phalombe were oriented to the PSAT during a one-day orientation. Facilities were given a period of two months to use the tool. During this period, supervision and mentorship were conducted by the district PMTCT coordinator. After two months, an evaluation meeting was conducted to assess the outcome and collect feedback from end users. Data from each PSAT was used to measure progress across the 13 indicators. Facilities were then able to compare performance by month to evaluate trends and review action plans.

LESSONS LEARNED: Across the 6 indicators, there was an average increase of 19% in PMTCT performance. All indicators with improvement of 5% and above were considered statistically significant. The tool has shown that it has potential to improve or sustain facility performance if used consistently. Facilities reported that the tool was helpful and easy to use. Furthermore, there was great improvement (from 27% to 93%) in completeness of the data.

CONCLUSIONS/NEXT STEPS: The PMTCT self-assessment tool is a simple, effective that can contribute to improving and sustaining facility performance. The tool will be recommended for continued use in the district, as well as considered for national scale-up for use in other districts to improve performance of the PMTCT programme.

PEE1696

A UNIQUE METHOD FOR BUILDING COMMUNITY SUPPORT FOR AND EXPANDING ACCESS TO SYRINGE ACCESS PROGRAMS: PICKING UP IMPROPERLY DISCARDED SYRINGES AND USING APP-BASED TRACKING

R. Hoffman[1], W. Bastian[1], G. Reynolds[1], J. Hecht[2]
[1]San Francisco AIDS Foundation, Syringe Access Services, San Francisco, United States, [2]San Francisco AIDS Foundation, Program Administration, San Francisco, United States

BACKGROUND: Syringe access programs (SAPs) are evidence-based interventions that reduce HIV transmission. San Francisco's SAPs distribute over 3.75M syringes annually. Many syringes are returned through disposal sites and kiosks, although homelessness, displacement, experience with police and mental health symptoms affect individuals' ability to return syringes. San Francisco residents have raised concerns about improperly discarded syringes, threatening support for needs-based SAPs.

DESCRIPTION: With funding from the Mayor's Office, San Francisco AIDS Foundation (SFAF) established the Pick Up Crew, which runs 7 days/week, 12 hours/day, picking up improperly discarded syringes and responding to real-time requests from the community. SFAF developed a software platform and smartphone app, enabling SFAF to rapidly dispatch and process pickup requests and to communicate with residents in real-time. Geolocation data allows for coordination of team activity and analysis of hotspots.

Residents can request a clean-up through email, text, or anonymously through SFAF's website, with most residents requesting by texting the location and pictures of syringes. SFAF staff then respond to the text with status updates, names of team member(s) dispatched, and estimated time of removal. Within 1-2 hours, the Pick Up Crew disposes of syringe(s) and sends a photo to the resident confirming removal.

LESSONS LEARNED: The Pick Up Crew collected 234,506 syringes in over 50 San Francisco neighborhoods in 2019, with the rapid dispatches increasing from a few dozen in January 2019 to over 200 per month in November 2019. Personalized communications and timely pick-ups build relationships with local residents. Some residents opposed to SAPs became supporters of syringe access in online neighborhood forums after their experience with the Pick Up Crew.

An unexpected outcome was increasing disposal options for individuals experiencing homelessness. Once the Pick Up Crew started walking the streets and developing positive relationships with homeless individuals, these individuals started saving syringes for safe disposal with the Pick Up Crew. The number of returns from PWID experiencing homelessness increased from 500 in June 2018 to 15,226 in February 2019.

CONCLUSIONS/NEXT STEPS: This program enables SAPs to build community support, prevent accidental needle sticks, improve quality-of-life for local residents, and increase disposal options for homeless residents.

PEE1697

A NOVEL APPLICATION OF THE PEPFAR SIMS TOOL: LESSONS LEARNED BY THE COLOMBIA ARMED FORCES

C. Simpson[1], S. Ávila Mira[2], Y. Guerrero[3], D. Osorio[3], S.M. Montano[1,4]
[1]Department of Defense HIV/ AIDS Prevention Program, San Diego, United States, [2]Colombian League Against HIV, Bogota, Colombia, [3]Colombian Armed Forces, Direccion General de Sanidad Militar, Bogota, Colombia, [4]U.S. Naval Medical Research Unit No. 6, Lima, Peru

BACKGROUND: The Site Improvement Monitoring System (SIMS) tool was developed as a comprehensive site-level monitoring and evaluation tool to ensure the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) funded programs are delivering quality HIV care and treatment services across sites. To improve quality within the Colombia Armed Forces (CAF) HIV clinics (CHC), who are not supported by PEPFAR, an innovative application of the SIMS tool was used to assess the quality of HIV care and treatment.

DESCRIPTION: The Department of Defense (DOD) HIV/AIDS Prevention Program (DHAPP) works in partnership with Liga Colombiana de Lucha Contra el Sida (LigaSida), a non-profit organization, to collaboratively improve HIV-related services within the CAF health system. In 2018, the inability for CAF to sufficiently monitor quality of care provided by CHCs was identified as an important gap in the military HIV response. To address this, DHAPP and LigaSida provided training and mentorship to CAF in implementation of a tailored SIMS tool. In 2018 and 2019, CAF officials implemented site visits using the tailored SIMS tool.

LESSONS LEARNED: As a result of the implementation of the tailored SIMS tool at 11 sites: (1) for the first time, this tool was used in a sustainable way within a South American military to enable HIV-related quality assessment in quality, supplies and medicines management, counseling, testing, laboratory and index case quantification, (2) there was buy-in by CAF on the benefits of monitoring the HIV response, (3) CAF identified areas for improvement and successful outcomes has increased.

CONCLUSIONS/NEXT STEPS: The success of the CAF-tailored SIMS tool implementation demonstrates how countries with little HIV-specific foreign assistance and no PEPFAR funding at the site level can still benefit from existing PEPFAR tools and magnify the impact of PEPFAR investment beyond PEPFAR-funded activities. In the push to reach global epidemic control by 2030, increased availability and adoption of SIMS and other PEPFAR-developed tools by national health systems outside of PEPFAR-funded sites could expand cost-effective and sustainable activities aligned with the WHO 2030 goal of epidemic control beyond PEPFAR-funded sites.

PEE1698

DIFFERENCES IN VIROLOGIC SUPPRESSION AMONG HIV-INFECTED ADOLESCENTS AGES 10-19 YEARS IN A HIGH HIV BURDEN STATE IN INDIA

P. Deoraj[1], T. Mundhe[2], K. Yewale[3], A.K. Srikrishnan[4], L. Gabhane[1]
[1]Maharashtara State AIDS Control Society, Public Health Department, Mumbai, India, [2]Maharashtara State AIDS Control Society, Indian Administrative Services, Mumbai, India, [3]World Health Organization, Public Health, Mumbai, India, [4]YRG CARE, Public Health, Chennai, India

BACKGROUND: Over the past decades, the Indian HIV/AIDS Control Program has been successful in reducing HIV transmission and associated mortality, but poor treatment adherence, suboptimal viral suppression, and drug resistance remain barriers to achieving the

UNAIDS last '95' target, especially among adolescents. We characterized the prevalence and factors associated with failure to achieve virologic suppression among HIV-infected adolescents in Maharashtra, India.

METHODS: We utilized program data from 5,589 HIV-infected adolescents accessing HIV treatment services under the National AIDS Control Program in Maharashtra and with available viral load data from between February 2018 and December 2019. Virologic failure was defined as HIV RNA >1000 copies/mL. Multivariable logistic regression was used to examine the association of age, sex, recent CD4 cell count and regimen type and virologic failure.

RESULTS: In the sample, 44% of adolescents were 10-14 years old and 56% were 15-19 years old. The median recent CD4 count was 658 (interquartile range, 430-910). Nearly half (46%) were female and the majority (83%) were on first line ART, followed by 17% on second line ART; only 10 adolescents were on third line ART. 35% experienced virologic failure and the prevalence varied significantly by age, sex, recent CD4 count, and regimen type. Those on second-line ART had the highest prevalence of virologic failure (52%) compared to those on first line (32%) and third line (40.0%) ART. After adjustment, the likelihood of viral suppression remained significantly higher among female adolescents, those aged 15-19 years, with recent CD4 count >350 and were on first line treatments.

CONCLUSIONS: Virologic suppression was significantly lower among adolescents in this high HIV burden state than the UNAIDS global target of 95% and suppression varied by demographic and clinical characteristics. A comprehensive and holistic adolescent centric program, including psychosocial support and treatment literacy, is needed to overcome this gap. Programs should target males, younger adolescents, and those transitioning to second or third line treatment as well as those transitioning from paediatric to adult ART care.

PEE1699

SMS INNOVATION FOR MANAGING STOCK OF HIV COMMODITIES IN A RESOURCE LIMITED SETTING USING THE HEALTH FACILITY REAL TIME ARV STOCK STATUS (RASS) MONITORING SYSTEM IN UGANDA

S. Wasike[1], M. Kaye[2], E. Akello[2], M. Agaara[3], M. Seru[4], S. Sendagala[5], S. Baveewo[5], B. Elur[5], A. Ndizihiwe[5], J.A. Ward[5], A. Adeyemo[6], A. Boore[1]
[1]U.S Centers for Disease Control and Prevention, Health Systems Strengthening Branch, Kampala, Uganda, [2]Makerere University School of Public Health - Monitoring and Evaluation Technical Support, Kampala, Uganda, [3]Ministry of Health, Aids Control Program, Kampala, Uganda, [4]Ministry of Health, Pharmacy Department, Kamplala, Uganda, [5]U.S Centers for Disease Control and Prevention, Strategic Information Branch, Kampala, Uganda, [6]U.S Centers for Disease Control and Prevention, Atlanta, United States

BACKGROUND: Uganda has roughly 1.1 million clients on antiretroviral therapy and is on track to meet UNAIDS 90-90-90, but has lacked a system to monitor stock status of HIV commodities at district and facility levels. The real-time ARV Stock Status (RASS) monitoring system was developed to provide health managers with needed information to monitor stocks and enable re-distribution to avoid stock-out.

DESCRIPTION: RASS implementation started in June 2017 in health facilities using pre-defined coding to report weekly stock on-hand, stock received, and any adjustments through a SMS text messaging to an mTRAC toll free number. The SMS report is processed by the RASS monitoring system, which interoperates with the national electronic Health Information System (eHMIS) to populate a dashboard with stock levels and need per facility. The RASS dashboard is a public site that can be accessed by all stakeholders to regulate stock levels as well as undertake evidence-based actions in logistic planning, such as redistributing HIV commodities from overstocked to understocked facilities.

LESSONS LEARNED: Facilities required on average 1 training session to utilize RASS correctly. After a national roll-out, 83 % of ART-providing facilities use RASS, with an average reporting rate of 60%. Facilities, districts, and central MoH report constant utilization of the data to redistribute and track stocks.

The RASS monitoring system has been essential to:

- Ensure optimal distribution of HIV commodities minimizing the risk of stock outs and contribute to the HIV treatment cascade. The mean stock-out rate has been reduced from 37% in CY17Q3 to 17% in CY19Q3.
- Lower operational costs with reported savings up to 17,000 USD a year in some regions spent on sending teams for physical counts.
- Allow for coordination across stakeholders.
- Empower facility staff to better manage stocks and improve the quality of orders.
- Support reconciliation of HIV commodities orders by allowing facilities to compare orders placed against orders received.
- Support the Ministry of Health in stock planning

CONCLUSIONS/NEXT STEPS: In the absence of a national electronic stock tracking system, the RASS has been an effective and affordable tool to monitor stock levels, empower facilities and districts to better control stocks and avert stock-outs, and improve planning.

PEE1700

UTILISING UNSUPPRESSED VIRAL LOAD PATIENT-LEVEL DATA TO INFORM PROGRAMMATIC OPPORTUNITIES AMONG PRIORITY POPULATIONS IN FOUR DISTRICTS IN SOUTH AFRICA

R. Rapiti[1], J. Burgess[1], A. Nel[1], S. Rajab[1], Z. Makaba[1], C. Mahwire[1], O. Oyebanji[1], N. Thekiso[1], D. Naidoo[1], N. Koloane[1], S. Chatikobo[1], N. Mkhize[2], K. Hhlope[3], J. Motlhamme[4], N. Hlatshwayo[5], T. Malone[1]
[1]BroadReach Healthcare, Johannesburg, South Africa, [2]Ugu Provincial Department of Health, Ugu, South Africa, [3]King Cetshwayo Provincial Department of Health, King Cetshwayo, South Africa, [4]Nkangala Provincial Department of Health, Nkangala, South Africa, [5]Gert Sibande Provincial Department of Health, Gert Sibande, South Africa

BACKGROUND: According to UNAIDS, viral load (VL) coverage around the world remains low for people living with HIV (PLHIV) and on treatment. In South Africa, the VL suppression gap, that is, the number of PLHIV on treatment but not virally suppressed, is steadily increasing. Patient-level data was analysed to identify unsuppressed VLs and identify programmatic interventions to improve rates of VL suppression.

METHODS: For this retrospective cohort study, a review of the VL data of HIV-positive patients on standard first-line anti-retroviral treatment (ART) was undertaken at 315 public health facilities in the four districts (Gert Sibande, King Cetshwayo, Nkangala, and Ugu), in South Africa. Patients included were on ART for six months or more between October 2018 and September 2019. Patients with unsuppressed VLs were then mapped by facility using a geo-spatial mapping application.

RESULTS: The geo-spatial mapping showed the size and disaggregation of patients belonging to priority populations in relation to the locations of public health facilities. Across the four districts, the average

VL coverage was 73%, with 4% of all patients showing unsupressed VL levels. Thirty-six percent of patients with unsupressed VL were on ART for a period between seven and nine months. Each district showed differences across age and gender categories: Gert Sibande contributed to 71% of all unsupressed VL patients; in King Cetshwayo, 59% of females were virally unsuppressed. Additionally, in King Cetshwayo the lowest percentage of HIV-positive patients with an unsupressed VL was found in females 15-24 years (22%) and in Nkangala the lowest percentage was found in males 25-34 years (17%).

CONCLUSIONS: GIS maps show the concentration of patients with unsuppressed VLs and indicate areas as well as facilities where resources and enhanced efforts should be focused to improve viral suppression. The maps helped direct community-based, facility, and index testing interventions. For instance, facilities with high rates of unsuppressed VLs, facilities introduced and/or intensified enhanced counselling, retention and adherence support via SMS, case management support, appointment systems, and intensive and effective ustilisation of clinical chart reviews. The next step is to develop a viable protocol to measure the effectiveness of GIS mapping in HIV programming within these districts.

PEE1701

TECHNICAL EFFICIENCY AND PRODUCTIVITY OF PUBLIC DISTRICT HEALTH FACILITIES IN KWAZULU-NATAL PROVINCE, SOUTH AFRICA

T.K. Babalola[1], I. Moodley[1]
[1]*University of KwaZulu-Natal, Public Health, Durban, South Africa*

BACKGROUND: Over the years, efforts were been directed towards reducing the burden of diseases within South Africa with most attention directed at prevalent communicable diseases such as HIV/AIDS and Tuberculosis. Given the high levels of poverty in the country, healthcare remains largely the responsibility of the government. The public hospitals cater for the health care needs of the majority of the population. The public district hospitals (DHs) constitute a major proportion of public hospitals and consume a larger portion of the government's total hospital budget. With the level of resources been pumped into these facilities, it essential to ensure efficient allocation and utilization. Thus, this study was aimed at assessing the technical efficiency of selected public district hospitals in the country.

METHODS: Innovative approaches; Data envelopment analysis (DEA) and Malmquist total factor productivity (MTFP) were deployed in assessing technical efficiency, adjustments needed to make inefficient facilities more efficient and determination of total productivity growth over the period under study. Input data such as medical and other personnel and output information such as outpatient visits were retrieved from the databases of the district health information system (DHIS) for three consecutive financial years (2014/15, 2015/16 and 2016/17). A total of 38 DHs were included in the study.

RESULTS: Data analysis revealed that the proportion constant return to scale (CRS) technically efficient facilities were 12 (31.6%), 16 (42.1%) and 14 (36.8%) in 2014/15, 2015/16 and 2016/17 respectively while the variable return to scale (VRS) technically efficient facilities were 22 (57.9%), 19 (50.0) and 21 (55.2%) respectively for the three consecutive years. Input and output adjustments needed to make inefficient DHs efficient were also identified. On average, the total productivity of DHs increased by 4.8 percent over the three years. Technical growth (innovation) of 6.9 percent recorded by the hospitals contributed majorly to the total productivity improvement.

CONCLUSIONS: In order to meet the continuous health care needs of the people, it is important to adopt techniques that ensure the efficient use of available healthcare resources towards yielding an optimal health service delivery. Some of these techniques were highlighted in this study.

PEE1702

USING MACHINE LEARNING (ML) APPROACH TO IDENTIFY TO PEOPLE LIVING WITH HIV (PLHIV) WITH HIGH VIRAL LOADS IN ORDER TO SUPPORT PRIORITIZATION OF VIRAL LOAD (VL) TESTING SCALE-UP IN INDIA

S. Kamal[1], N. Goel[1], A. Mathur[2], Y. Bansal[2], U. Chawla[2]
[1]*Ministry of Health and Family Welfare, Govt. of India, National AIDS Control Organization, New Delhi, India,* [2]*William J Clinton Foundation, New Delhi, India*

BACKGROUND: India is committed to achieving 90-90-90 goals by 2020, and introduced routine VL monitoring in 2018. ~600,000 PLHIV have received VL testing so far. Rapid scale-up is required to provide VL monitoring to ~1.3 million PLHIV on ART currently. This paper explores a ML approach for prioritizing VL scale-up. This could help those most at risk of treatment failure receive rapid care.

DESCRIPTION: Viral load failure (VLF) was defined as VL ≥ 1000 copies/ml. Program data for 86,482 PLHIV (VLF rate = 19.91%) from all states was selected for analysis based on the patient having at least 1 VL test within Feb 2018 and October 2019, at least 2 CD4 tests 3 months or before the VL test, and at least 1 CD4 test after the VL test. The data was randomly split 80:20 into a training and test set respectively with VLF rate equivalent to total data-set. A logistic regression model was built to rank all patients in descending order of likelihood of VLF and trained on the training data-set. VLF was predicted as a function of 10 variables, including ART regimen, facility for treatment, education, occupation etc.

LESSONS LEARNED: CD4 counts before VL test, time between CD4 test and Viral Load test, and ART regimen were highly significant ($p<0.001$). The chi-square test found the model highly significant at < $2.2e^{-16}$. The model returned an Area under curve (AUC) for the Receiver Operator Characteristic Curve plot (ROC) of 0.8348 and 0.8263 on the training and test set respectively, demonstrating good fit. On the test set, the model identified 57.1% of the total VLF in the top deciles of the rankings, implying VLF rate of 56.9% in top 20% PLHIV vs a VLF rate of 10.7% in the remaining 80%.

CONCLUSIONS/NEXT STEPS: If implemented, the preliminary model could help identify 57% potential VLF by targeting just 20% of PLHIV. This accuracy can be further increased to a classic Pareto distribution using feature engineering. Through a more targeted VL monitoring scale-up approach, the program could fast-track care provision to those at risk of VLF and support faster achievement of the third 90.

PEE1703

UTILIZING MOBILE HEALTH GEOSPATIAL DATA TO EVALUATE HIV SERVICE IMPLEMENTATION IN RAKAI, UGANDA

V.W. Kimiko[1], A. Anok[2], I. Mbabali[2], R. Pollard[3], K.R. Amico[4], J. Mulamba[2], E. Bugos[1], A. Thomas[1], H. Hutton[3], G. Nakigozi[2], L. Chang[3]
[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Rakai Health Sciences Program, Kalisizo, Uganda, [3]Johns Hopkins School of Medicine, Baltimore, United States, [4]University of Michigan, Ann Arbor, United States

BACKGROUND: Mobile health (mHealth) interventions are increasingly used to support HIV service delivery and can collect spatial (GIS) data to improve implementation. *Health Scouts* was a novel community health worker (CHW) intervention that used mHealth tools to support HIV service delivery and was recently evaluated in a cluster-randomized trial. To identify clusters with high lost to follow-up (LTFU) rates, we used geocoded mobile data collected from a *Health Scouts* smartphone application.

DESCRIPTION: From 2015-2018, the *Health Scouts* intervention was deployed in an HIV hyperendemic fishing community on Lake Victoria (HIV prevalence ~40%) divided into 40 clusters (20 *Health Scouts* intervention; 20 control). CHWs conducted home-based counseling supported by a mobile app with visits planned for every three months. Geocoded data at each visit was analyzed to identify hotspots with high LTFU rates (defined as no recorded visits over 12 months).

LESSONS LEARNED: 6297 total geocoded visits were analyzed; 2342 participants (or "clients") were visited at least once. 603 (26%) of participants were LTFU. As shown in the Figure, there was substantial variation in the number of follow-up visits. Logistic regression also found substantial spatial variability. For example, participants in the largest intervention cluster had higher odds of having clients LTFU compared to most other clusters ($p < 0.01$). Results also suggested that this spatial variation did not strictly follow cluster boundaries as originally planned as some visits appeared to occur in control clusters or outside of original study boundaries.

[Figure. Spatial variation in follow-up rates. Number of follow-ups within 12 months of study enrollment]

CONCLUSIONS/NEXT STEPS: This geospatial analysis of a CHW intervention promoting HIV services helped identify substantial variability in the implementation of counseling visits. This type of analysis could support near real-time monitoring and evaluation and more efficient targeting of limited programmatic resources. An additional benefit is the identification of geospatial lapses in intervention fidelity, such as intervention delivery outside of intended geographic areas.

PEE1704

CHANGING CHARACTERISTICS OF NEW HIV DIAGNOSES OVER TIME IN RURAL MALAWI

E. Wroe[1], S. Kulinkina[1], L. Nazimera[2], E. Connolly[1], D. Suffrin[1], E. Ndarama[2], J. N'gambi[2], C. Kanyenda[1], M. Boti[1], M. Jamu[1], B. Mailosi[1], N. Price[3]
[1]Partners in Health, Neno, Malawi, [2]Ministry of Health, Neno, Malawi, [3]Partners in Health, Boston, United States

BACKGROUND: Identifying and treating all people living with HIV is an important component of the Malawi government's commitment to Universal Health Coverage. Since 2004, Malawi has seen significant investment in HIV testing strategies. Neno District is located in rural Malawi with a population of approximately 165,000 and in 2019 had met the UNAIDS first target of enrolling over 90% of the expected cohort in the district. We hypothesized that enrollment trends over time could offer clues about shifting local epidemiology or vulnerable populations that may need particular attention as the district approaches complete enrollment.

METHODS: All newly enrolled HIV patients for the calendar years of 2009, 2014, and 2019 were included in a retrospective analysis. Data was collected on routine paper charts and recorded in an electronic medical record. Descriptive characteristics are reported for gender, age, BMI, and WHO Stage. Significance was determined by chi-square for proportions.

RESULTS: Newly enrolled patients totaled 1,777 (62% female) in 2009, 1,031 (61% female) in 2014, and 905 (57% female) in 2019, with gender not significantly changing over time ($p=0.051$). Mean age at enrollment was 32.4, 31.7, 32.0, respectively ($p=0.42$). Adolescents made up 2.8% of the new enrollees in 2009, 5.1% in 2014, and 5.9% in 2019, with children under 10 years declining, from 9.9% in 2009 to 5.3% in 2019. ($p<0.01$). Mean BMI increased, from 19.6 in 2009 to 21.0 in 2019 ($p<0.01$), and the proportion of new enrollees with WHO Stage IV illness at enrollment decreased from 5.6% in 2009 to 3.5% in 2019 ($p<0.01$).

CONCLUSIONS: Enrollment trends reveal declining numbers as the district approaches complete enrollment, with gender remaining stable over a decade. While mean age did not change, the relative contribution of adolescents to new cases increased. And the relative contribution of young children decreased, likely reflecting improved prevention of vertical transmission, this remains critical need for improvement. The new patients appeared healthier over time, which could represent earlier case finding. Observing these trends routinely may provide programs with areas for improvement over time, such as intensified efforts in vertical transmission and in adolescent health.

PEE1705

SYNCHRONIZATION OF APPOINTMENTS FOR MUTUAL PATIENTS OF GLOBAL HOPE BOTSWANA AND BOTSWANA-BAYLOR INFECTIOUS DISEASE CLINIC

L. Ketumile[1,2], B. Beo[1], K. Gabegwe[1], S. Lekalake[1], P. Masalila[1], J. Slone[1,2], M. Matshaba[1,2]
[1]Baylor Children's Clinical Centre of Excellence, Gaborone, Botswana, [2]Baylor College of Medicine, Houston, United States

BACKGROUND: Survivorship care for paediatric cancer survivors provides early detection of and intervention for potentially serious late-onset complications as well as the reduction of adverse effects of cancer treatment. Patients with both HIV infection and cancer at Botswana-Baylor Children's Clinical Centre of Excellence (Botswana-Baylor) are co-managed by Global Hematology-Oncology Paediatric Excellence (HOPE) the Paediatric Infectious Disease Clinic as they' require ongoing follow-up by both clinical teams. Synchronization of follow up appointments for patients co-managed by Global HOPE and the PIDC could improve pediatric cancer survivorship care.

DESCRIPTION: Pediatric cancer patients living with HIV are enrolled in the Botswana Pediatric Oncology Database (BPOD) by Global HOPE and the electronic medical record (EMR) for the PIDC. The two databases are not linked and, with the exception of the demographic information, contain different clinical data. The appointment dates are set independently and therefore are not typically on the same date for co-managed patients.

Upon completion of cancer treatment, the follow ups for the Global HOPE patients are usually quarterly for a year, then biannually for a year and annually starting with the third year. The HIV program check-up appointments are 1 to 3 months apart. From May 2019, a retrospective chart review of Global HOPE and Botswana-Baylor HIV clinic was performed to improve care for cancer survivors living HIV.

LESSONS LEARNED: Ten patients (4 males and 6 females) aged between 5 and 13 years are currently co-managed by Global HOPE and the PIDC. The predominant cancer was Kaposi sarcoma, followed by retinoblastoma and Burkitts lymphoma. In April 2019, at the start of the review the compliance of routine check-ups in the PIDC was 100% and 40 % for Global HOPE. As a result, Global Hope synchronised appointments with those of the PIDC. By end of June 2019, the compliance for Global HOPE had improved to 60%.

CONCLUSIONS/NEXT STEPS: Synchronization of appointment dates for cancer survivors living with HIV seems to promote compliance with follow up check-ups for cancer survivors and should therefore be considered for scale up to optimize the health outcomes. Further studies are recommended to study this phenomenon.

APPROACHES TO USING DATA TO IMPROVE PROGRAMMING

PEE1707

TARGETED CASE-FINDING IN HIV PARTNER NOTIFICATION SERVICES: A DEMOGRAPHIC ANALYSIS OF ROUTINE DATA IN JOHANNESBURG, SOUTH AFRICA

K. Rees[1,2], H.E. Struthers[1,3], J.A. McIntyre[1,4], J.L. Dunlop[1,5]
[1]Anova Health Institute, Johannesburg, South Africa, [2]University of Witwatersrand, Department of Community Health, School of Public Health, Johannesburg, South Africa, [3]University of Cape Town, Division of Infectious Diseases and HIV Medicine, Department of Medicine, Cape Town, South Africa, [4]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa, [5]University of Witwatersrand, Division of Community Paediatrics, Department of Paediatrics and Child Health, Johannesburg, South Africa

BACKGROUND: Partner notification and index testing can improve case-finding efficiency. The modality was integrated into public-sector services in Johannesburg, South Africa's biggest city, with an estimated 666,000 people living with HIV, 57% on antiretroviral therapy (ART). ART coverage is particularly poor in children 5-14 years, adolescent girls and young women (AGYW) and adult men. We aimed to determine whether this modality can improve targeted case-finding in these groups.

METHODS: We conducted a descriptive analysis of routine data collected from October 2018 to September 2019. Counsellors collected data in registers; these were captured and manged using REDCap and analysed in STATA. We created testing cascades and calculated yield by age and gender and calculated the frequency and proportion of new positives that originated from index clients in each age/gender group.

RESULTS: 17,173 clients were offered partner notification; 11,852 provided at least one contact, on average 1.4 contacts per index. Of 16,273 contacts, 1,726 were known positive (11%) and 4,139 were tested (25%), with a positivity rate of 31% yielding 1,263 new HIV diagnoses. Proportion of contacts tested was highest under 5 years and lowest in men over 45 years. 31% of untested contacts were men 25-44 years (2453 men). Positivity was above 45% in adult men and women. Positive 5-14-year olds were largely identified through index women 25-44 years old (71%) although 13% came from male indexes and 10% from older women. AGYW 15-24 years old were identified through men 25-44 years (77%), and 9% through men 15-24 years old. Positive male contacts 25-44 years were identified largely through women the same age, although 13% were identified through AGYW. Positivity in female contacts of men 25-44 years ranged from 46% in AGYW to 61% over 45 years. Overall in the district, 25% of new diagnoses were in men 25-44 years and 1% in children 5-14years, compared to 41% and 5% of those diagnosed through index testing.

CONCLUSIONS: Index testing is an effective way to find HIV positive people in target groups. The number of clients offered index testing and the number of contacts tested should be improved, through self-testing and research exploring community perceptions.

PEE1708

IS OUR HIV TESTING REALLY TARGETED? PREDICTORS OF HIV POSITIVITY FROM A LARGE HIV TESTING PROGRAM IN UGANDA

G.W. Ojamuge[1], J. Gonzalez Perez[2], M. Kahungu[3], K. Ssamula[1], L. Buzaalirwa[1], J. van den Hombergh[4], P. Iutung[1]
[1]AIDS Healthcare Foundation - Africa Bureau, Kampala, Uganda, [2]AIDS Healthcare Foundation - Africa Bureau, Kigali, Rwanda, [3]AIDS Healthcare Foundation - Uganda CARES, Kampala, Uganda, [4]AIDS Healthcare Foundation Netherlands, Amsterdam, Netherlands

BACKGROUND: To meet UNAIDS targets for epidemic control, 90% of People Living with HIV (PLHIV) should know their status. To achieve this, new WHO guidelines include novel approaches, one being social-network based testing for delivering high impact HIV Testing Services (HTS). In a generalized epidemic setting, the revised 2019 guidelines prioritize HIV testing at all entry points in health facilities and community testing targeting key populations (KP). In this study, we analyzed data from a large testing program in Uganda to identify predictors of HIV positivity.

METHODS: A cross sectional study was conducted using a digital database for all clients aged 15 to 64 years tested with the support of AIDS Healthcare Foundation (AHF) in Uganda between January and December 2018. It contains information on socio-demographic characteristics, risk of infection, modality of HIV testing and previous test results. Logistic regression was used to determine predictors of the outcome of testing.

RESULTS: A total 112,044 clients were tested of whom 4.1% were HIV positive, mean age 29 years, 42% were males, 68% were either married or cohabiting and 81.6% were re-testers. Provider initiated testing (PITC) was associated to decrease odds of testing positive (OR: 0.75, 95% CI: 0.68-0.81, p<0.001) compared with client-initiated testing. Testing 3 or more times in the previous 12 months was associated with lower odds of being HIV-positive (OR: 0.29, 95% CI: 0.24-0.33, p<0.01) compared to those not tested in past 12 months. Clients who divorced or separated were likely to be HIV positive (OR: 2.55, 95% CI: 2.29 -2.85, p<0.001) compared to those who were married or cohabiting.

CONCLUSIONS: The observed low positivity in PITC, suggests that even in high HIV burden settings, HTS at the health facility should be targeted to those with perceived risk of HIV infection, rather than be offered to all individuals. Individuals who report HIV negative results and have previously tested 3 or more times in the past 12 months without risk of HIV exposure do not need to be tested. Individuals who are divorced or separated should be targeted for HIV testing.

PEE1709

THE IMPORTANCE OF CONTINUOUS QUALITY IMPROVEMENT IN HIV RECENCY TESTING IN FIVE DISTRICTS IN NAMIBIA

A. Beukes[1], P. Katota[2], E. Dzinotyiweyi[3], P. Zimunya[2], R.S. Beard[1], J. Hifindwako[4], M. Grasso[2], I. Pietersen[1], S. Welty[5], S. Naimhwaka[2], B. Parekh[6], E. Yufenyuy[6], X. Tan[6], S. Hong[1], E. Dziuban[1], A.-M. Nitschke[3], N. Hamunime[3], L. Ashipala[3], L. Bikinesi[3], D. Chiwara[4]
[1]Centers for Disease Control and Prevention, Windhoek, Namibia, [2]University of California, Windhoek, Namibia, [3]Ministry of Health and Social Services, Windhoek, Namibia, [4]Namibia Institute of Pathology, Windhoek, Namibia, [5]University of California, San Francisco, United States, [6]Centers for Disease Control and Prevention, Atlanta, United States

BACKGROUND: In June 2019, the Namibian Ministry of Health and Social Services (MOHSS), with support from PEPFAR, rolled out the country's first HIV recent infection surveillance system in five districts. To ensure quality of testing, site level rapid testing was combined with laboratory confirmation and viral load testing to confirm all recent cases.

METHODS: Persons attending HIV testing services aged ≥16 years and newly diagnosed with HIV infection were offered a rapid test (Asanté™ HIV-1 Rapid Recency® Assay) for recent infection (RTRI) at antiretroviral (ART) facilities after confirming their HIV status. All RTRI recent, as well as 10% of long-term (LT) samples, were sent to the laboratory for repeat RTRI. A RTRI recent result in the laboratory with a VL≥1,000 copies/mL was defined as recent infection. Extensive continuous quality improvement (CQI) actions were initiated after roll-out at the site-level to address quality issues including discrepancies between RTRI recent results at testing sites compared to the laboratory.

RESULTS: Among 1,103 persons tested with RTRI at the site level, 153, including 89 recent and 64 long-term, were sent to the laboratory for repeat testing. Of the 153, 62/64 (97%) long-term and 57/89 (64%) recent were found to test the same by RTRI at laboratory level. Forty-one of the 57 (72%) found to be recent in the laboratory via RTRI were confirmed recent using VL and 16 (28%) were corrected to long term. Discordant recent RTRI results between site and laboratory decreased from a high of 46% in August, just after CQI visits were initiated, to a low of 8% in October, indicating effectiveness of CQI site level visits.

CONCLUSIONS: CQI activities, which commence with roll-out, are essential to ensure accurate recency data. Specifically, it is important to address testing issues at sites to reduce the discrepancies between site level and laboratory-based testing. VL testing is also important to discriminate between newly diagnosed infections and patients who are already on ART. Recency testing could become a vital tool to reduce transmission and thus reach epidemic control if scale-up is conducted as a joint effort between program and laboratory with a strong mind to quality assurance.

PEE1710

USING A PROJECT MANAGEMENT APPROACH TO MAXIMISE ON THE INCREASED DEMAND AND UPTAKE OF VOLUNTARY MEDICAL MALE CIRCUMCISION DURING THE HIGH-VOLUME WINTER SEASON: SOUTH AFRICA'S PROJECT 400K CAMPAIGN

Z.B. Dube[1], L. Mulenga[1], A. Kwarteng[1], D. Kalombo[2], G. Mvuma[2], B. Msimanga-Radebe[3], A. Letsoalo[4], D. Loykissoonlal[4], C. Bonnecwe[4]
[1]Genesis Analytics, Health, Johannesburg, South Africa, [2]Foundation for Professional Development, Pretoria, South Africa, [3]World Health Organization, Pretoria, South Africa, [4]South African National Department of Health, MMC Programme, Pretoria, South Africa

BACKGROUND: Due to the high burden of HIV, South Africa has set ambitious voluntary medical male circumcision (VMMC) targets, aiming to circumcise an additional 2.5 million males by 2022. To capitalise on the high demand for VMMC during the winter season, the National Department of Health (NDoH) implemented the "Project 400k" campaign. This campaign used an innovative project management approach to track implementation of the programme to achieve its ambitious target of 400,000 circumcisions during the winter season.

METHODS: The management and organisation of Project 400K were led by NDoH. NDoH and PEPFAR agencies collaborated on programme implementation and coordinated communication between implementing partners which was facilitated through bi-weekly project management meetings held at NDoH. A principle focus of Project 400K was data monitoring, achieved through weekly data submissions. Data was collated, cleaned and analysed by NDoH. Performance trends were tracked to inform district-specific evaluations. This allowed implementing partners to identify poor performing districts and devise mitigating actions promptly. Progress of implementing these actions was monitored and outcomes were reviewed at subsequent meetings. Partners also reported on demand-creation initiatives, clients follow up rates, adverse events (AEs) and management thereof.

RESULTS: Project 400k successfully achieved 305 801 VMMC's. This performance was an increase of 39 814 circumcisions compared to the previous year's winter campaign. This performance contributed 58% of the 600 000 FY19/20 National target. Holding regular meetings with partners improved collaboration, accountability and created healthy competition among partners. This resulted in increased performance through the communication of effective strategies and successful demand creation initiatives. Presenting data regularly and in a user-friendly manner allowed for timely identification of challenges and monitoring of remedial actions.

CONCLUSIONS: Monitoring performance regularly, during the high-volume winter season kept implementing partners accountable for performance, ensured effective monitoring of AEs, and allowed for the sharing of best practices. NDoH was able to effectively monitor the capturing of data onto the District Health Information System. Through the implementation of the project management approach, NDoH maximised on the increased demand and uptake of VMMC services during the winter season within the priority target population of HIV negative males aged 15-34 years.

PEE1711

VALIDATING THE COST OF OUTPATIENT VISITS ACROSS HIV AND TB INTERVENTIONS

L. Bollinger[1]
[1]Avenir Health, Glastonbury, United States

BACKGROUND: The country-specific outpatient unit costs developed by the WHO-CHOICE team are used widely in program planning and budgeting, including in modeling costs and impacts for the health sector. These costs use a sophisticated econometric methodology to estimate the "hotel" costs of outpatient visits, that is, all costs except the costs of drugs and diagnostics. Recent primary source facility-level data have become available that can be used to validate these predicted country-specific outpatient unit costs.

METHODS: We use primary source facility-level data available from the Global Health Cost Consortium's Unit Cost Study Repository to calculate outpatient visit unit costs, excluding drugs and diagnostics, for multiple interventions in HIV and tuberculosis for as many countries as possible. These data are supplemented by further primary source facility-level data from recent studies in HIV, including studies costing pre-exposure prophylaxis and antiretroviral treatment interventions. These calculated unit costs are then compared with the corresponding country-specific WHO-CHOICE outpatient visit unit costs to assess their reliability.

RESULTS: Preliminary results indicate that for many of the countries, the costs that are calculated using the primary facility-level data from the literature are well within one standard deviation of the WHO-CHOICE predicted outpatient unit costs. Some countries and regions are more accurate than others; for example, the outpatient visit costs calculated from the literature for countries in sub-Saharan Africa tend to be closer to the WHO-CHOICE predicted costs, while results for countries in Eastern Europe tend to be less accurate.

CONCLUSIONS: The outpatient unit costs developed by the WHO-CHOICE team are used in many policy-making settings, including in countries where primary source facility-level data are not available. We validate the WHO-CHOICE predicted costs by calculating similar "hotel" costs of outpatient visits using available primary source facility-level data for countries and find that they are relatively accurate. Thus, it is feasible for the WHO-CHOICE data to be used in policy-making settings, including the new UNAIDS 2025 AIDS targets exercise.

PEE1712

TRIANGULATING DATA FOR ADVOCACY: CONNECTING THE DOTS BETWEEN COMMUNITY-LED MONITORING ACTIVITIES, HEALTH SYSTEMS, AND HEALTH OUTCOME DATA

A. Buenz Makulec[1], D. Kibira[2], D. Weikum[3], S. Atuhura[4], S. Alamo[5], C. Martin[3]
[1]Excella Consulting, Washington DC, United States, [2]Coalition for Health Promotion and Social Development, Kampala, Uganda, [3]Centers for Disease Control and Prevention, Atlanta, United States, [4]Spectrum Uganda Initiatives, Kampala, Uganda, [5]Centers for Disease Control and Prevention, Kampala, Uganda

BACKGROUND: Community score cards (CSC) capture data to foster community dialogue and connect health service users, community members, and health workers within a "community-led monitoring" approach to improve the quality of health services. While rich quantitative and qualitative data are generated, robust trend analysis of that data, triangulating with related health outcomes and data sources, and displaying data in dashboards has been limited.

DESCRIPTION: The Centers for Disease Control and Prevention have supported the development of a Tableau software dashboard to display CSC data, qualitative comments, community action plans, and HIV program data across multiple health facilities. Efforts build upon existing siloed Excel workbooks and Word documents that are limited in analysis to a single facility. Excella Consulting led a user-centered design process with Uganda discovery research conducted by a local expert in score card implementation and use, virtual user feedback sessions on mockups and prototypes, and an in-country workshop with local civil society organizations (CSOs) conducting CSC to validate an interactive dashboard and gain feedback. A framework has been developed to support data management, visualization and analysis and can be followed to blend additional data sources.

LESSONS LEARNED: Several key lessons learned emerged from the community engagement activities. Feedback from the Uganda workshop informed the addition of key features (e.g., data driven legends), that help the users learn how to read different chart types. Review of existing data management revealed files formatted for human readability rather than analysis or in tables. Basic data transformation capabilities with Excel formulas and tools like Tableau Prep can improve efficiency.

Participants described how data is captured and managed (often with paper and electronic methods) and identified opportunities for creating efficiencies in data capture and use. Considerations were made for promoting long-term use and sustainability of data visualization tools like dashboards by the formation of a coalition of CSOs to share results collectively.

CONCLUSIONS/NEXT STEPS: The final CSC dashboard will be used nationally by Ugandan CSOs in 2020 for community-led monitoring in health facilities. This dashboard and its creation framework will be adapted and used by HIV programs in other countries, to support community-led development and capacity building.

PEE1713

CREATION AND USE OF A CONTINUOUS QUALITY IMPROVEMENT (CQI) SYSTEM TO IMPROVE HIV-1 RECENT INFECTION SURVEILLANCE AND ROUTINE TESTING SERVICES IN MALAWI, 2019

A. Ernst[1], R. Merai[1], D. Payne[2], K. Curran[3], J. Njala[4], E. Bambo[5], N. Smith[1], S. Welty[1], S. Vedapuri[3], R. Myrick[1], G. Rutherford[1], R. Nyirenda[6]
[1]University of California, Institute for Global Health, Global Strategic Information, San Francisco, United States, [2]Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Center for Global Health, Lilongwe, Malawi, [3]Centers for Disease Control and Prevention, Division of Global HIV and Tuberculosis, Center for Global Health, Atlanta, United States, [4]Global AIDS Interfaith Alliance, Blantyre, Malawi, [5]UC Global Programs for Research & Training, Maputo, Mozambique, [6]Ministry of Health, Department of HIV and AIDS, Lilongwe, Malawi

BACKGROUND: The 2015 Malawi Population-based HIV Impact Assessment found that Malawi is approaching the UNAIDS 95-95-95 goals. Achieving and maintaining epidemic control will require tailored prevention interventions and integrated testing models, identifying new infections to interrupt HIV transmission. Malawi has established a recent (i.e. within last 12 months) HIV infection surveillance system, integrating a rapid test for recent infection (RTRI) into routine HIV testing services (HTS), beginning at 23 facilities in Blantyre district. To monitor fidelity of recent infection surveillance, we implemented a continuous quality improvement (CQI) approach through routine monitoring visits.

DESCRIPTION: CQI processes are based on the Plan-Do-Study-Act (PDSA) model. CQI comprises a range of activities, including tracking performance, assessing indicators against standards (e.g. SOPs), prioritizing challenges/gaps, conducting root cause analyses (RCAs), developing action plans, testing interventions, and monitoring effectiveness. Using a CQI checklist, we assessed six key service delivery areas: staff, procedures, data, recruitment, physical facility, and supplies.

We collected data using tablet-based Open Data Kit during monthly site visits and displayed data in real-time on color-coded scorecards and dashboards for use by stakeholders at facility and above-site levels. RCAs and action plans were developed with site-level CQI teams at underperforming facilities.

LESSONS LEARNED: From May-October 2019, we conducted 176 CQI visits and 218 RCAs, identifying 14 unique root causes, including: minimal/insufficient training (41%), stock issues (16%), low staff motivation (12%), client refusal (11%), and poor facility coordination (6%). CQI teams developed action plans addressing challenges, including training/re-training, strengthening supply chains, mentoring, and developing staff schedules. Quickly identified and implemented, these solutions improved both routine HTS and recent infection surveillance, leading to programmatic changes and sharing of best practices. At 30% of facilities (n=7), simple interventions like mentorship in eligibility and procedures yielded better recruitment and routine test kit delivery led to fewer stockouts.

CONCLUSIONS/NEXT STEPS: As recent infection surveillance expands, key attention is required to ensure high-quality testing and data. CQI activities enable stakeholders to contextualize data to make informed public health decisions. Identifying and addressing challenges early, implementing teams can ensure accurate data to identify trends and suspected clusters of new infections and tailor appropriate public health responses to interrupt transmission.

PEE1714

CLIENT-INITIATED RETESTING AMONG PEOPLE WITH KNOWN HIV POSITIVE STATUS, MOZAMBIQUE, 2019

A. Couto[1], I. Sathane[1], G. Amane[1], N. Chicuecue[1], J. Seleme[1]
[1]Ministry of Health, National STI and HIV/AIDS Program, Maputo, Mozambique

BACKGROUND: The World Health Organization recommends retesting for verification of HIV positive persons prior to antiretroviral therapy (ART) initiation to prevent unnecessary treatment. Retesting is not recommended for HIV positive persons on ART; nonetheless; some HIV positive persons on ART self-initiate retesting to reconfirm their HIV status. This results in serious negative individual and public health consequences. In Mozambique no national level data was available on previous HIV positive diagnosis at voluntary HIV testing and counseling (HTC) sites.

DESCRIPTION: In March 2019, the Ministry of Health updated HTS data tools to enable collection of previous HIV positive diagnosis from persons voluntary testing for HIV at all public HTS facilities in Mozambique (n = 1,634). Providers were trained to identify and record previous HIV positive status for persons testing HIV positive on HTS paper-based forms, which are aggregated at the clinic level and digitized into a national database. We analyzed aggregated HTS routine program data from April to December 2019, and applied literature estimates on HIV testing costs and impact of ART on performance

of HIV rapid tests, to better understand the extent of self-initiated retesting in the country and potential cost implications of unnecessary retesting.

LESSONS LEARNED: Nationally 2,703,331 persons received client-initiated HTS during this time; 91% of tests were conducted at health-care facilities and 9% at community sites. At health facility sites 141,1226 (6%) persons tested positive and 15,383 (10.9%) reported re-testing. At community sites 22,811 (10%) were HIV positive and 2,754 (12.1%) retested. Because clients testing HIV negative were not asked about prior HIV diagnosis, we estimated that an additional 914 persons with prior HIV positive status self-initiated retesting with seronegative results. This unnecessary client-initiated retesting was estimated to have cost US$219,443 ($52,567–1,070,271) during the period analyzed.

CONCLUSIONS/NEXT STEPS: This evaluation provides a first time estimate of client-initiated retesting among persons voluntarily testing for HIV in Mozambique. Improved screening of persons seeking HTS is needed to prevent unnecessary testing especially in community settings. Further research is needed to understand why client-initiated retesting is a common practice among HIV positive patients in Mozambique.

PEE1715

IMPROVING THE QUALITY OF ROUTINE DATA FOR THE PREVENTION OF MOTHER-TO-CHILD TRANSMISSION IN FOUR DISTRICTS IN SOUTH AFRICA

R. Rapiti[1], V. Sigauke[1], M. Teffo[1], D. Naidoo[1], O. Oyebanji[1], N. Thekiso[1], N. Koloane[1], N. Mkhize[2], K. Hlope[3], J. Motlhamme[4], N. Hlatshwayo[5], T. Malone[1,1]

[1]BroadReach Healthcare, Johannesburg, South Africa, [2]Ugu Provincial Department of Health, Port Shepstone, South Africa, [3]King Cetshwayo Provincial Department of Health, King Cetshwayo, South Africa, [4]Nkangala Provincial Department of Health, Nkangala, South Africa, [5]Gert Sibande Provincial Department of Health, Gert Sibande, South Africa

BACKGROUND: BroadReach HealthCare supports the KwaZulu-Natal and Mpumalanga Provincial Departments of Health in strengthening the Prevention-of-Mother-to-Child-Transmission (PMTCT) programme in 4 districts with high HIV prevalence in South Africa. A component of this support is to strengthen data reporting to correctly reflect the performance of the PMTCT programme.

DESCRIPTION: A data review tool was developed and implemented across 315 facilities for the reporting period October 2017 to September 2018. The tool revealed data quality issues including incorrect and inconsistent reporting of first antenatal client visits before 20 weeks or later; incomplete recording of information in patient folders and PMTCT registers; incorrect recording of antenatal care (ANC) data elements from the registers; inconsistent capturing of patient details in registers by service providers; and lack of registers to record relevant data indicators. A defined data quality procedure was subsequently developed and implemented to address the data discrepancies to ensure the data correctly reflects the performance of the PMTCT programme.

LESSONS LEARNED: The intervention was implemented between October 2018 and September 2019 and included:

- Validating patient file information against what was captured on the national patient management data base (TIER.Net).
- Mentoring service providers on antenatal data element definitions, which comprised of strengthening the facility level data flow process and the completion of the PMTCT registers.
- Reviewing and consolidating PMTCT data between different facility registers.
- Aligning the recording of monthly facility summary data documents to update Web DHIS.
- Conducting monthly analysis of PMTCT data recorded on Web DHIS.
- Assigning accountability to data and clinical teams to ensure correct recording of patient information in registers and patient files.

The implementation of the interventions resulted in a data improvement of 30% in missing data at the end of the September 2019.

CONCLUSIONS/NEXT STEPS: We noted that tackling data quality is important to ensure relevant programming interventions are in place. Maintenance of scheduled and consistent data quality activities within facilities is imperative in correcting data issues for the PMTCT programme. Early staff mentoring contributed to accurate reporting. Assessing barriers at all levels that contribute to poor data quality should be included as an approach to data quality.

PEE1716

USING REAL TIME, INDIVIDUAL- LEVEL DATA TO IMPROVE DREAMS PROGRAMMING IN ZAMBIA

W. Mizinga[1], V. Kapotwe[1], L. Nkhoma[2], T. Kipingili[2], A. Phiri[3], G. Lingenda[3], A. Oakley[4], E. Kuhlik[4]

[1]Pact Zambia, Monitoring and Evaluation, Lusaka, Zambia, [2]Pact Zambia, Health, Lusaka, Zambia, [3]USAID Zambia, Health, Lusaka, Zambia, [4]Pact US, Monitoring and Evaluation, Washington, United States

BACKGROUND: In Zambia, HIV prevalence among youth ages 15-24 is 7% (8% women, 5% men). Young women are infected at an annual rate of 15 times higher than young men (2016 Zambia population-based HIV impact assessment). In response to these alarming figures, DREAMS

Zambia was designed to target the most vulnerable AGYW in the urban areas hardest hit by the HIV epidemic.

DESCRIPTION: At initiation into the program, AGYW are screened for risk of HIV and enrolled in DREAMS using comprehensive forms which help identify risk factors and categorize participants accordingly. During the first two years of the project, data was collected and entered as aggregate which was a gap as individual analysis of the girls enrolled could not be done. District Health Information Software 2 (DHIS2), was then introduced allowing for real-time, validation, analysis, and presentation of individual-level and aggregate data.

LESSONS LEARNED: Data management using DHIS2 has led to improved programming at multiple programmatic levels: DREAMS Center staff are able to analyze and recommend interventions for each girl and track site progress using dashboards and analytics. Project senior management are able make timely and evidence-based decisions to improve programming.

In FY19, data captured in DHIS2 showed 2,688 (18%) AGYW enrolled in Livingstone District reported being sexually active at screening. Real-time data collection and visualization of this data allowed center managers to respond immediately upon enrollment of the identified participants with condom distribution and provision of HIV testing. Among the 2,688 AGYW identified, 75% received condoms and 47% received an HIV test. Of those who are were tested, two AGYW were found positive, both of whom were successfully linked for treatment.

CONCLUSIONS/NEXT STEPS: Shifting from aggregate data entry to using real-time individual data in DHIS2 has allowed the ZCHPP project team to make timely and informed decisions, thereby increasing

efficiency and effectiveness in program delivery. Additional in-depth data analyses of individual participant data using unique identifiers will be conducted on risk factors, service uptake, and health outcomes in order to analyze effectiveness of intervention combinations for scale-up and future programming recommendations.

Keywords: ZCHPP, DREAMS, DHIS2, AGYW, HIV

PEE1717

UTILIZATION OF A LEAN PRODUCT DEVELOPMENT STRATEGY TO IMPROVE THE SELF-REPORTING RATE IN AN HIV SELF-TESTING PROGRAM IN JOHANNESBURG, SOUTH AFRICA

A.Q. Amra[1], M. Simjee[1], M. Rademeyer[1], R. Nana[2], M. Phatsoane[2], T. Wonderlik[2], A. Tembo[2], V. Zishiri[2], F. Venter[2], K. Hatzold[3], M. Majam[2]
[1]A2D24, Johannesburg, South Africa, [2]University of the Witwatersrand, Ezintsha, Wits Reproductive Health and HIV Research Institute, Johannesburg, South Africa, [3]Population Sciences International, Johannesburg, South Africa

BACKGROUND: Lean product development is an iterative process that aims to achieve improved outcomes through minor amendments to that process. The purpose of the study was to increase the self-reporting rate in an HIV Self-Testing program using a lean product development approach.

DESCRIPTION: The study was implemented through selected Self-Test Africa (STAR) distribution site based in Gauteng, South Africa between October and December 2019. Participants using an Interactive Voice Recognition (IVR) platform follow a 7-day workflow, which includes two outbound SMS and an outbound call to aide self-reporting of their HIVST result. Every four weeks a new version of the model and reporting tool was launched based on the learnings from the previous sprint following lean development principles.

LESSONS LEARNED: 12 623 participants were active on the IVR platform during the three months of implementation. The baseline process uploaded data to the platform 72 hours after the initial distribution, benchmarking self-reporting at 2%. The second sprint improved the upload time, yielding reporting rates of 11%. The final sprint launched a minimum viable mobile data collection application increasing reporting rates to 46%.

Sprint	1	2	3
Data collection & upload	Manual > 72 hours	Manual < 48 hours	Mobile-app, automatic
Key iterative improvements	Baseline 7 Day IVR workflow	Stringent data validation and capturing IVR voice enhancements	Immediate SMS SMS wording refinement Intensive peer educator training
Number of consentees to IVR	4,097	7,648	878
IVR reporting rate	2%	11%	46%
Seropsitives	32%	26%	18%

[Table]

CONCLUSIONS/NEXT STEPS: The lean approach highlighted the 24-hour window after the distribution is key for reporting, highlighting the need for initiating the initial conversation with the participant at distribution. In the three months of implementation, the program improved reporting rates from 2% to 46% on the IVR system. Further iterations such as WhatsApp reporting, reduced IVR workflows, removing outbound calls and multi-language platforms are planned for implementation. These improvements to date are attributed to the lean approach which highlights the benefits of agile development for mHealth platforms. Process improvement methodologies such as Lean Development, and Six Sigma, can play a vital role in healthcare by creating incremental improvements to systems.

PEE1718

IMPLEMENTATION OF CONTINUOUS QUALITY IMPROVEMENT (CQI) USING PARTICIPATORY DATA DRIVEN APPROACH TO IMPROVE PMTCT PROGRAMME IN AMATHOLE DISTRICT, EASTERN CAPE, SOUTH AFRICA

O.G. Oyebanji[1], T. Mathole[1], D. Jackson[1], S. Gede[2], M. Youngleson[3]
[1]University of the Western Cape, School of Public Health, Cape Town, South Africa, [2]Eastern Cape Department of Health, Health, East London, South Africa, [3]Independent Consultant, Cape Town, South Africa

BACKGROUND: Eastern Cape Province, South Africa has recorded massive scale-up of Prevention of Mother-To-Child Transmission (PMTCT) of HIV programme over the past years. This can be attributed to the implementation of the National Strategic Plan on HIV, STIs and TB 2012 – 2016 and quality improvement projects aimed at reducing MTCT to less than 2% at six weeks post-delivery and less than 5% at 18 months of age by 2016. Despite this achievement, discrepancies in the facility level data, data reported at the district level and at the provincial level still exist.

We assessed the improvement made with 3 selected PMTCT programme performance indicators following implementation of Continuous Quality Improvement (CQI) projects in Amathole district, Eastern Cape, South Africa.

METHODS: Health Care Professionals (HCPs) were trained on quality improvement initiatives, on-site mentoring and supervisory support conducted and CQI implemented using participatory data driven approach.

Review of routine data from the District Health Information System on 3 selected PMTCT indicators for the period 2015/16 (prior to implementation of CQI) to 2016/17 (one year after implementation) and training of Health Care Professionals (HCPs) involved in CQI.

Analysis of data involved: (i) selection of the 3 PMTCT indicators; (ii) data cleaning; and (iii) comparison of the degree of proportional change in the improvement or non-improvement of the indicators in 30 facilities.

RESULTS: (i) T test result which showed statistically significant improvement for the selected 3 PMTCT indicators (ii) linear regression done established that number of staffs involved in QI activities significantly predict improvement in 2 of the 3 PMTCT indicators (ANC 1st visit before 20 weeks rate, ANC clients initiated on ART rate, but not ANC clients re-test rate) and (iii) Pearson's product-moment correlation showed strong negative correlation for the 3 selected PMTCT indicators.

CONCLUSIONS: Despite the data challenges issues, this analysis has showed that the implementation of CQI has plausibly positive effects on the overall performance of the 3 selected PMTCT indicators in Amathole district, Eastern Cape. We recommend implementation and scale up of CQI across other facilities. CQI can be implemented with fidelity to improve programme performance beyond PMTCT indicators.

PEE1719

REACHING THE HARD-TO-REACH GROUPS: ASSISTED PARTNER NOTIFICATION, AN EFFECTIVE APPROACH TO FINDING UNDIAGNOSED HIV POSITIVE MEN IN UGANDA

J. Baligobye[1], J. Kiwanuka[2], M. Muhindo Kahungu[1], M. Ndungu[2], G. Ojamuge[3], P. Iutung[3]
[1]AIDS Healthcare Foundation, Prevention, Kampala, Uganda, [2]AIDS Healthcare Foundation, Monitoring and Evaluation, Kampala, Uganda, [3]AIDS Healthcare Foundation, Africa Bureau, Kampala, Uganda

BACKGROUND: Background: HIV case finding and linkage to care are critical to the achievement of the first UNAIDS 90-90-90 targets. Men are at higher risk and lag behind in HIV prevention. In Uganda, approximately 20% of HIV positive individuals are unaware of their sero-status. To increase knowledge, World Health Organization highlights men as a hard to reach group. The Ministry of Health (MOH) recommends, Assisted Partner Notification (APN) as an effective way of reaching men who are sexually exposed to HIV. We compared effectiveness of APN and health facility testing on HIV case identification.

DESCRIPTION: Methods: A retrospective study was conducted among clients tested for HIV in Busia Health center and by Amalgamated Transport and General Workers Union (ATGWU), a Community Based Organization supported by AIDS Healthcare Foundation to conduct APN in Busia. Data used is for clients aged 15 years and older who consented to testing between May and December 2018. Standard MoH tools were used to collect the data. We compared HIV case detection and linkage to care between APN and testing at the health facility.

LESSONS LEARNED: Results: A total of 10,202 clients were tested, 5,691 (55.8%) were females, 210 (2.1%) tested through APN and overall 5.1% were HIV positive. Among APN client's, positivity was higher at 35.2% (95% CI 28.7%-41.7%) compared with 4.4%, (95% CI 4.0%-4.8%) among clients tested in the health facility. Among males tested through APN, positivity was higher at 30.8% (95%, CI: 21.9%-39.6%) compared to 3.5% (95%, CI: 0.1-7.0%) among males tested in the health facility. Equally, among females tested through APN, positivity was higher at 39.6% (95% CI 30.3-48.9%) compared to 5.2% (95% CI 4.6%-5.8%) among females tested in the health facility.

Overall, linkage to care and treatment was 91.3%, however it was higher among clients tested at the health facility at 92.1% (95% CI 87.5%-93.8%) compared to clients tested through APN at 86.5% (95% CI 78.7%-94.3%). There were no differences in linkage by approach after adjusting for sex.

CONCLUSIONS/NEXT STEPS: In high burden settings with generalized epidemics, APN is instrumental in enhancing male involvement in HIV prevention and is effective in finding HIV positive men.

PEE1720

HIV AND STRENGTHENING OF SUPPLY CHAIN SYSTEMS: IMPLEMENTING AN OPEN-SOURCE SUPPLY CHAIN MANAGEMENT SOFTWARE SYSTEM TO MAXIMIZE ACCESS TO HEALTH COMMODITIES

J.A. Greenspan[1], V. Avignon[2], L. Galinksy[1,3], J. Miranda[4], K. Nagel[1], P. Ntirenganya[1], A. Pierson[1], J. Mukherjee[1,5,6]
[1]Partners In Health, Boston, United States, [2]Zanmi Lasante, Croix-des-Bouquets, Haiti, [3]MIT Sloan School of Management, Cambridge, United States, [4]OpenBoxes, Shorewood, United States, [5]Harvard Medical School, Boston, United States, [6]Brigham and Women's Hospital, Boston, United States

BACKGROUND: Partners In Health (PIH) works in 11 countries to build capacity and strengthen health systems in the public sector. While HIV scale-up has necessitated robust supply chain systems and morbidity-based procurement and distribution of ART, the same has not been true of other health commodities in many countries. HIV programs depend on strong health systems, and access to medications, medical supplies, diagnostics, and equipment is a cornerstone of those systems. Because of this need, PIH developed a software system to improve the public supply of health commodities required for comprehensive HIV prevention and care. PIH uses this tool, OpenBoxes, to support ministries of health in Haiti, Liberia, Malawi, Rwanda, and Sierra Leone.

DESCRIPTION: Like many global health organizations, PIH historically had limited visibility of supply chain data to inform inventory management, forecasting, budgeting, and procurement. PIH largely based purchasing decisions on historical spend, adding safety stock across product categories to absorb consumption increases. In 2012, PIH began a phased implementation of OpenBoxes, a free, open-source supply chain management software designed for global health implementers. OpenBoxes has minimal hardware requirements, flexible implementation options, an intuitive user interface, and functionality to enable coordination across multiple supply chains (i.e. public sector, non-governmental organizations).

LESSONS LEARNED: With the development and implementation of OpenBoxes, PIH has increased visibility across the HIV prevention and care supply chain, enabling real-time monitoring of inventory levels, expiry dates, and incoming and outgoing quantities of health commodities. These data inform decisions regarding order frequency, safety stock, and in-country distribution. OpenBoxes also transforms consumption and request data into a demand signal, facilitating purchasing decisions that are based on real need and correct for observed gaps in availability, thereby preventing stock outs. Since PIH began using demand data for forecasting, fill rates (the percentage of demand met from available stock) have consistently reached 90%.

CONCLUSIONS/NEXT STEPS: Implementing purpose-built software can facilitate supply chain improvements in resource-limited settings by increasing data visibility, highlighting opportunities for process improvements, informing budgets, and increasing forecast accuracy. OpenBoxes is one example of such software—a free, open-source option for ministries of health and healthcare implementers globally to use and to contribute to.

PEE1721

BUILDING A SUSTAINABLE HIV CASE SURVEILLANCE AND RESPONSE SYSTEM FOR REACHING EPIDEMIC CONTROL: LESSONS LEARNED FROM ETHIOPIA

F. Eshetu[1], S. Abdella[2], A. Aklilu[3], A. Haile[1], W. Beletel[2], Z. Melaku[3], D. Habte[1], T. Deressa[2], J. Aliy[3], S. Alemayehu[1], A. Hassen[2], T. Harris[4], H. Ali[5], A. Silassie[3], J. Ahmed[1], A. Feleke[2], S. Kaydos-Daniels[1], C. Ross[1], N. Gezahegn[2], T. Moshago[2], Y. Kassa[2], B. Moges[2], T. Kifle[2], G. Tollera[2], E. Abate[2]

[1]CDC Ethiopia, Addis Ababa, Ethiopia, [2]Ethiopian Public Health Institute, Addis Ababa, Ethiopia, [3]ICAP Ethiopia, Addis Ababa, Ethiopia, [4]ICAP, New York, United States, [5]U.S. CDC, Atlanta, United States

BACKGROUND: In countries nearing HIV epidemic control, like Ethiopia, cross-sectional surveys are insufficient to monitor a waning national epidemic and emerging micro-epidemics. We describe the context, process of implementation and lessons learned in establishing HIV case surveillance, in integration with routine public health emergency management system (PHEM) in Ethiopia.

DESCRIPTION: Phase-I implementation is currently in 432 high-volume public and private health facilities. Data at HIV testing points is collected using paper-based case reporting form (CRF) – which captures information on client identifiers, demographic, baseline clinical, laboratory, and risk assessment data, and RTRI (AsanteTM) Result. The CRFs are entered into an electronic database (REDCap) at health facilities through a secure internet connection and stored at Ethiopian National Public Health Institute (EPHI) data servers. De-duplication and matching[1] will be done through defined algorithms derived from multiple client identifiers. Data analysis and visualization is done weekly and report is shared with stakeholders to guide individual and cluster HIV response. Regions have access to their respective datasets, to use for follow up of identified clusters. Phase II implementation will include longitudinal case surveillance system to capture data on all sentinel events[2], along the care cascade.

[1] De-duplication and matching is done to assure that each client is added to database only once

[2] All subsequent key events related to the specific HIV positive individual

LESSONS LEARNED: The key to successful implementation is government ownership and integration of HIV case surveillance with PHEM. Government of Ethiopia developed national HIV case surveillance guidelines, specifying implementation methodology and roles and responsibilities of PHEM and HIV/TB research departments – starting from facilities up to Ministry of Health. The collaboration between PHEM and HIV/TB research directorates in public health institute has enabled the government to leverage human and financial resources from both departments in moving the surveillance forward. The platform built will serve other PHEM disease reporting as well.

CONCLUSIONS/NEXT STEPS: Ethiopia has demonstrated that HIV case surveillance can be established in resource limited settings. Introduction of case surveillance has shifted Ethiopia's HIV program from being guided through measuring aggregated services to tracking interventions at individual level and access to differentiated HIV services.

PEE1722

HOUSING OPPORTUNITIES FOR PERSONS WITH AIDS (HOPWA) PROGRAM: THE U.S. GOVERNMENT'S HIV HOUSING PROGRAM

R. Harcrow[1], A. Palilonis[1], L. Steinhauer[1]

[1]U.S. Department of Housing and Urban Development, Office of HIV/AIDS Housing, Washington, United States

BACKGROUND: The U.S. Department of Housing and Urban Development's Housing Opportunities for Persons With AIDS (HOPWA) program was enacted with the purpose to provide states and localities with the resources and incentives to devise long-term comprehensive strategies for meeting the housing needs of low-income persons with HIV/AIDS and families of such persons. The HOPWA program is the only federal program that targets resources to address the housing needs of low-income persons with HIV/AIDS and their families.

DESCRIPTION: HOPWA funding to States, localities, and community organizations provides housing assistance to low-income persons living with HIV/AIDS and their families who are experiencing housing instability or are at risk of homelessness. Communities may use HOPWA funds to support several different types of housing assistance and supportive services to assist clients with achieving and/or maintaining stable housing and positive health outcomes. In 2017, the Housing Opportunities Through Modernization Act (HOTMA) updated the HOPWA funding formula to target resources to reflect the current epidemic. Previously, the data used to determine eligibility for HOPWA formula funding and allocate resources was the cumulative number of AIDS cases. HOTMA changed the source of data to the number of individuals living with HIV or AIDS. The law provides that HOPWA modernization will begin in Fiscal Year 2017 and will be phased in over 5 years to avoid highly volatile shifts in either direction for any one jurisdiction.

LESSONS LEARNED: Over 60,000 households have been assisted annually since 2017 when HOPWA modernization was implemented. Full implementation of HOPWA Modernization will occur in 2022. Annually from 2017-2019, grantees reported over 90% of clients served had contact with a case manager, had contact with Primary Care, and accessed income. The Office of HIV/AIDS Housing (OHH) has provided webinars, tools, and direct technical assistance to assist HOPWA formula grantees with adjusts for gains or losses in funding under modernization.

CONCLUSIONS/NEXT STEPS: OHH continues to adjust and support HOPWA grantees experiencing shifts in funding due to HOPWA Modernization. The range of housing assistance and supportive services allows grantees flexibility to meet the housing and service needs of low-income persons living with HIV and their families in their communities.

PEE1723

END-TO-END STOCK DATA VISIBILITY: A CRITICAL TOOL IN THE PREVENTION OF HIV/AIDS COMMODITY STOCKOUTS

M. Sie[1], M. Belayneh[2], K. Payne[1], K. Karimova[1], Y.R. Parekh[1]
[1]USAID Global Health Supply Chain Program - Procurement and Supply Management Project, Arlington, United States, [2]U.S. Agency for International Development, Washington, DC, United States

BACKGROUND: The uninterrupted availability of HIV/AIDS commodities are critical to controlling the epidemic in low- and middle-income countries where pharmaceutical supply chain management capacity remains nascent.

DESCRIPTION: In support of UNAIDS 90/90/90 goals, the USAID Global Health Supply Chain Program-Procurement and Supply Management (GHSC-PSM) project regularly compiles and analyzes central-and site-level stock data on HIV/AIDS commodities to avert potential stockouts. GHSC-PSM monitors HIV/AIDS commodity availability, monthly, in 59 central and regional warehouses in 18 countries. Facility-level data are monitored at more than 13,000 health facilities in 12 countries. Taken together these data provided PEPFAR, and others, visibility into product availability at the lowest levels of the supply chain.

Data are shared through a limited-access online dashboard with PEPFAR and other stakeholders, fostering increased collaboration to modify commodity procurements and expediate shipments as needed. These surveillance reports help reduce stockout risks of first- and second-line antiretrovirals and rapid test kits.

LESSONS LEARNED: From December 2018 to December 2019, the GHSC-PSM identified 110 instances of stockout risks in 18 countries through these tools. Based on this analysis, PEPFAR worked closely with donors to manage stockouts and expedite shipments avoiding program interruption.

Country data visibility also allowed decision makers to manage transitions to superior regimens such as tenofovir/lamivudine/dolutegravir (TLD) and leverage better collaboration between partners and countries. For example, when Zimbabwe identified a shortage of Lamivudine/Zidovudine 150/300 mg, Haiti transferred medicine from its overstocked supply. As a result, Zimbabwe shortened its procurement timeline by 11 weeks and achieved cost savings, while Haiti averted product expiry. This extensive repository of HIV/AIDS commodity data also allows program managers to rationalize the number of products procured and ensure patients are on optimal regimens.

CONCLUSIONS/NEXT STEPS: Increased data visibility is contributing to the resiliency and adaptability of country supply chains. Stakeholders are better able to work together from a common dataset to make informed decisions and identify solutions. GHSC-PSM is continuously improving the tools and expanding coverage to include more warehouses and facilities in more countries to hasten the achievement of epidemic control.

PEE1724

ESTIMATING THE ECONOMIC COST OF A COMPREHENSIVE HIV PROGRAM FOR KEY POPULATIONS IN KENYA AND MALAWI: A MICRO-COSTING APPROACH

J.L. Figueroa[1], S. Bautista-Arredondo[2], J.E. Sanchez[1], G. La Hera-Fuentes[3], L.E. Ochoa[4], R. Gómez[4]
[1]National Institute of Public Health of Mexico, Health Economics, Cuernavaca, Mexico, [2]National Instutite of Public Health of Mexico, Health Economics, Cuernavaca, Mexico, [3]University of Newcastle, Newcastle, Australia, [4]National Institute of Public Health, Health Economics, Cuernavaca, Mexico

BACKGROUND: Several studies in low-and-middle-income countries have documented the cost of HIV services; however, most of these studies focus on services delivered in clinical settings for the general population. As a result, the literature on the economic costs of services for key populations (KP)—i.e., men who have sex with men, sex workers, and transgender people—remains remarkably scant. Such lack of evidence is partly explained by the complexity of services for KP that calls for innovative costing study designs. To fill this gap, we propose a micro-costing approach to produce robust estimates of the economic costs of HIV services for KP.

METHODS: We developed a framework to comprehensively capture costs of services in facilities funded by the LINKAGES program in Kenya (n=30) and Malawi (n=15). By tracing all relevant categories of program activities, we identified inputs and outputs linked to those activities. We estimated total costs, cost structure, and unit costs of services (elements) during fiscal years 2018 and 2019. We collected data at the above-facility and facility levels.

RESULTS: Preliminary results suggest an average cost of HIV testing services of US$58 in Kenya and US$410 in Malawi, whereas, the average cost per client diagnosed was US$8,018 in Kenya and US$1,602 in Malawi. The average cost per client on ART was US$799 in Kenya and US$65 in Malawi. Also, the analysis suggests that between 30% (for PrEP in Kenya and STI services in Malawi) and 88% (for ART in both Kenya and Malawi) correspond to costs of clinical supplies only. The results also point to large cost variability across facilitates and services in both countries.

CONCLUSIONS: Our micro-costing approach considers key components of service delivery to KP – pre-service delivery activities, project management, and interventions required to reach KP, and is comprehensive enough to capture key components usually ignored in other studies (e.g., cost of donated supplies and drug therapies). To our knowledge, there are no previous studies that estimate precisely the economic cost of HIV services for KPs, especially in low-and-middle-income countries.

PEE1725

HARD EVIDENCE VS. SOFTWARE: TIPS FOR MAINTAINING AN EVIDENCE-BASED EHEALTH HIV PREVENTION INTERVENTION ACROSS EVOLVING SOCIOTECHNICAL CONTEXTS

D. Li[1,2], R. Saber[2], B. Mustanski[2,1,3]
[1]Northwestern University Feinberg School of Medicine, Psychiatry and Behavioral Sciences, Chicago, United States, [2]Northwestern University, Institute for Sexual and Gender Minority Health and Wellbeing, Chicago, United States, [3]Northwestern University Feinberg School of Medicine, Medical Social Sciences, Chicago, United States

BACKGROUND: Evidence-based eHealth HIV prevention interventions purport to provide advantages in cost-efficient dissemination over face-to-face programs. In practice, however, the technology can become a barrier to its own scalability. Traditional community-based HIV service infrastructures often have limited technical capacity to host and maintain complex technology, thus requiring new approaches to intervention delivery. EHealth interventions must also keep up with technological progression, social expectations, and advancements in HIV prevention science over time to maintain relevance and acceptability as well as functionality. The need for constant adaptation creates a challenge for ensuring ongoing effectiveness of such interventions. Little guidance exists on how to adapt eHealth interventions over time. Here, we describe principles that eHealth researchers can use to remain agile and responsive to shifting sociotechnical contexts while preserving intervention effectiveness.

DESCRIPTION: Keep It Up! (KIU!) is a web-based, multimedia HIV prevention program for young men who have sex with men (YMSM) designated as a best-evidence intervention by the CDC. In its efficacy trial, KIU! (version 2.0) was shown to reduce not only condomless anal sex but also STI incidence. A newer version of KIU! (3.0) is now being implemented across 44 US counties. Though KIU! 3.0 has substantially refreshed form and functionality, we believe it retains the intervention principles of 2.0.

LESSONS LEARNED: Maintaining the effects of KIU! over time while adapting to evolving contexts comprises four steps: First, we made certain technological design choices upfront to increase the ability of KIU! to respond to software bugs as well as new content. Second, we systematically adapted the intervention content utilizing Mohr's intervention principles framework. Third, we track and monitor usability metrics and feedback logs to identify emerging issues with the intervention. Fourth, we continue to evaluate the intervention using an effectiveness–implementation hybrid type III trial design.

CONCLUSIONS/NEXT STEPS: Achieving the promise of cost-efficient scalability of eHealth HIV interventions requires a paradigm shift toward treating interventions as a set of principles rather than a static product, coupled with proper planning in intervention design and ongoing usability monitoring. Novel methodologies, such as hybrid and optimization designs, can be used to continue assessing effectiveness.

EVALUATING LARGE-SCALE PROGRAMMES: APPROACHES TO RIGOROUS EVALUATION

PEE1726

AN EVALUATION OF THE EFFECTIVENESS, FACILITATORS AND BARRIERS OF HIV TEEN CLUBS IN ACHIEVING SUCCESSFUL TRANSITION FROM TEEN TO ADULT CARE IN BLANTYRE, MALAWI USING THE RE-AIM FRAMEWORK

J. Galagade[1]
[1]University of Malawi - College of Medicine, Public Health, Blantyre, Malawi

BACKGROUND: High attrition has been noted as a major problem when HIV positive adolescents move from pediatric to adult care. WHO's 2016 review of various Differentiated Service Delivery for adolescents recognized HIV Teen Club as an efficient model for ensuring strong adherence and viral suppression. With over 150 HIV Teen Clubs in Malawi, we estimated the proportion of eligible Adolescent Living with HIV(ALHIV) enrolled in HIV Teen Clubs who successfully transitioned to adult care within six months of the expected transition time, assessed health facilities' fidelity in the implementation of HIV Teen Clubs' adult care transition protocols and factors associated with successful transition from HIV Teen Clubs to adult Care.

METHODS: We conducted a retrospective cohort study in primary health facilities in Blantyre, Malawi using patient records of ALHIV in Teen Clubs who had reached the recommended transition age of 18/19 years between July - December 2017, collected observational data and perspectives of service providers in health facilities implementing HIV Teen Club.

RESULTS: Of the 131 ALHIV enrolled in the study from 14 facilities, we found that there is low proportion (6.9%) of eligible ALHIV enrolled in Teen Clubs who successfully transitioned to adult care within six months of the expected transition time. Fidelity in implementation of Teen Clubs' adult care transition protocols in health facilities was found to be medium (61.7%) and the findings also showed an association between implementation fidelity and ALHIV successful transition to adult care. Facility location and ownership was noted to be significantly associated with ALHIV successful transition. While sex of the adolescent and the type of adolescent guardian were observed to be not significantly associated with successful transition. Lack of training in transitioning ALHIV, lack of clear guidelines or tools to support transition, inadequate human resource and refusal of ALHIV to transition to adult care were factors noted to negatively influence successful transition.

CONCLUSIONS: Transitioning ALHIV from pediatric to adult care should be considered a serious challenge facing Malawi health system. The existence of many ALHIV in Teen Clubs who are refusing/failing to transition to adult care should be seen as a problem needing serious attention

PEE1727

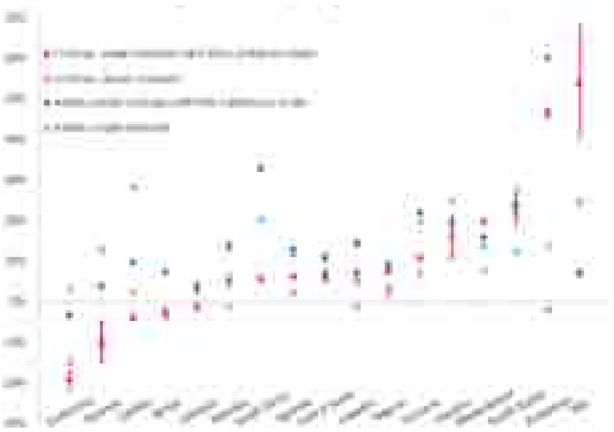
TRENDS IN PEDIATRIC ANTIRETROVIRAL TREATMENT IN U.S. PRESIDENT'S EMERGENCY PLAN FOR AIDS RELIEF-SUPPORTED COUNTRIES IN SUB-SAHARAN AFRICA, 2016 - 2019

E.M. Rabold[1], R. Bain[1], R. Bhatkoti[1], D. Carpenter[1], S. Modi[1], E. Rivadeneira[1], K.A. Battey[1], M. Patel[1]
[1]*Centers for Disease Control and Prevention, Division of Global HIV & TB, Atlanta, United States*

BACKGROUND: United Nations Programme on HIV/AIDS (UNAIDS) reports that only 54% of children living with HIV (CLHIV) are on antiretroviral treatment (ART) compared to 62% of adults, despite previous global initiatives focused on closing this gap. Robust modeling approaches can improve assessment of temporal trends in CLHIV on ART, especially relative to adults.

METHODS: Using U.S. President's Emergency Plan for AIDS Relief (PEPFAR) data, we used time-series modeling, assuming a Poisson distribution, and the log-link function to estimate and compare annual percent change in CLHIV <15 years on ART to adults ≥15 years on ART in PEPFAR-supported facilities in countries with availability of >95% age-disaggregated data from October 2016 to June 2019. We compared modeled estimates of annual percent change with simpler estimates calculated from the natural log of the first and last time points.

RESULTS: Of 17 countries eligible for analysis, 12 demonstrated growth in CLHIV on ART; of these, five [Tanzania, Lesotho, South Sudan, Zimbabwe, and Democratic Republic of the Congo (DRC)] demonstrated >10% annual growth (Figure 1). Five (Cameroon, Rwanda, Zambia, Kenya, and Ethiopia) demonstrated negative or no growth. In contrast, all countries except Cameroon demonstrated growth in adults on ART, with ten countries demonstrating >10% annual growth. Annual growth in adults on ART outpaced growth in CLHIV on ART for all countries except South Sudan, Lesotho, and DRC. Compared to modeled estimates of growth in CLHIV on ART, corresponding simple estimates were lower in eight countries and similar in seven countries.



[Figure. Annual percent change in CLHIV on ART by country with 95% confidence limits, 2016-2019]

CONCLUSIONS: Less than half of countries with age-disaggregated data demonstrated substantive growth in CLHIV on ART, regardless of the trend estimation approach. Due to the interdependence of time series data, the model likely estimates change over time more accurately than simpler methods. Our results emphasize the need for more focused efforts to expand HIV treatment for CLHIV.

PEE1728

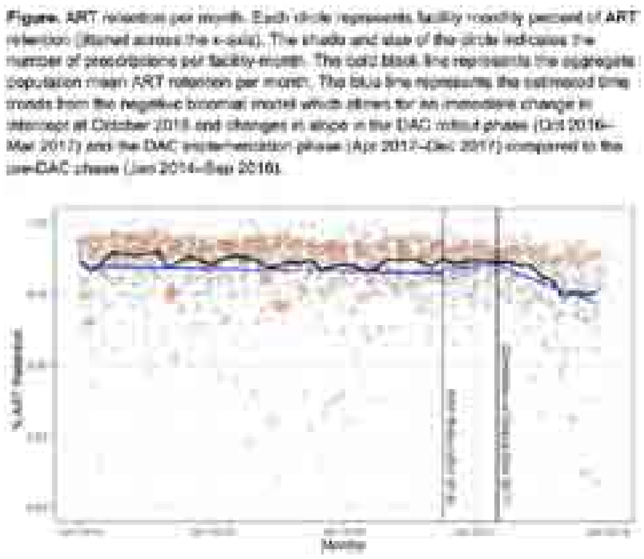
IMPACT OF COMMUNITY-BASED ART DISTRIBUTION ON ART RETENTION IN HAITI

L. Arakaki[1], D. Hergott[1], B. Morgan[1], R. Ermane[2], J.G. Honoré[3], J.G. Balan[3], G. Perrin[4], J.S. Valles[4], N. Puttkammer[5]
[1]*University of Washington, Department of Epidemiology, Seattle, United States,* [2]*Ministère de Santé Publique et de la Population (MSSP), Programme National de Lutte contre le VIH/SIDA (PNLS), Port-au-Prince, Haiti,* [3]*Centre Haitien de Renforcement du Système Sanitaire (CHARESS), Port-au-Prince, Haiti,* [4]*US Centers for Disease Control and Prevention, Port-au-Prince, Haiti,* [5]*University of Washington, Department of Global Health, International Training and Education Center for Health (I-TECH), Seattle, United States*

BACKGROUND: A community-based ART distribution strategy (DAC) was scaled up in Haiti in 2016 to improve antiretroviral therapy (ART) retention. We assessed the impact of DAC on average facility-level ART retention.

METHODS: Using an uncontrolled interrupted time series design, we assessed the impact of DAC on monthly ART retention in 24 facilities (January 2014–December 2017). Data were abstracted from iSanté. Each site's monthly ART retention was calculated as the proportion of ART visits during each month where patients returned for their ART refill within 30 days of the next expected visit. Adults on ART >=6 months were eligible to enroll in DAC. DAC was implemented in facilities between October–December 2016. Multivariable negative binomial models were used to model ART retention. P-values (p)<0.05 were considered statistically significant. We evaluated immediate impact of DAC and change in ART retention during DAC rollout phase (October 2016–March 2017) and DAC implementation phase (April–December 2017).

RESULTS: We included 20,918 adults and 291,498 study visits. Before DAC implementation, facility average monthly ART retention did not change significantly (risk ratio [RR], 0.999; 95% confidence interval [CI]: 0.998–1.000; p: 0.079). During 6-month DAC rollout, ART retention insignificantly increased (RR, 1.005; 95% CI: 0.995–1.015; p: 0.348). ART retention significantly decreased during DAC implementation phase compared to rollout phase (RR, 0.978; 95% CI: 0.964–0.991; p: 0.002). DAC implementation was associated with a non-significant immediate increase in ART retention (RR, 1.010; 95% CI: 0.962–1.060; p: 0.690).



[Figure]

CONCLUSIONS: DAC did not immediately affect facility-level ART retention in our study population and did not significantly increase retention during the rollout phase. Facility average monthly ART reten-

tion decreased in the implementation phase. Further investigation of the variability of DAC effectiveness across facilities in Haiti, DAC program procedures, participant characteristics, and other factors affecting program effectiveness is warranted.

PEE1729

NOVEL METHODOLOGY FOR ESTIMATING UNIQUE CLIENTS AND AVERAGE DURATION OF PREP USE FROM CROSS-SECTIONAL MONITORING AND EVALUATION DATA

E. Doyle[1], H. Subedar[2], N. Shoko[1], S. Jenkins[1], Y. Pillay[2]
[1]Clinton Health Access Initiative, Inc., Pretoria, South Africa, [2]South African National Department of Health, Pretoria, South Africa

BACKGROUND: Impact of oral PrEP on HIV incidence relies on high risk individuals using the product, and methods for estimating use trends (unique clients and duration of use) rely on client- or cohort-level longitudinal tracking systems. To streamline sustainable reporting and programmatic analysis, we aimed to develop and pilot a methodology for estimating and tracking quarterly 'unique client volumes' and 'average duration of use' trends from cross-sectional M&E data.

METHODS: Monthly tallies of PrEP initiation, follow-up, and restart visits were organized by key population, age, and gender. Quarterly 'unique client volume' was estimated by summing the evaluation quarter's month 1-3 initiation and restart visits and month 1 follow-up visits with the preceding quarter's month 2-3 follow-up visits. Quarterly 'average duration of use' was estimated by multiplying tallied monthly visits by number of prescription months falling within the evaluation quarter to yield 'total client-months of PrEP use'. 'Total client-months of PrEP use' was divided by 'unique client volume' to yield 'average duration of use.' These methods were piloted on South Africa's national PrEP M&E data from June 2016 to June 2019 using Excel to compare use trends across age, gender, and key population groups.

RESULTS: Thirteen quarters of 'unique client volume' and 'average duration of use' were successfully estimated from cross-sectional monthly visit tallies. Although 17,832 new individuals initiated PrEP between June 2016 and June 2019, only 6,737 unique clients were estimated to be actively on PrEP in Q2 2019, indicating a 13% quarterly increase (n=5,986 in Q1 2019), 117% annual increase (n= 3,100 in Q2 2018). Average duration of use varied by age, gender, and key population with males 35+ years at MSM sites representing the longest users on average (2.7 months; n=549) and females 16-18 years at public sites representing the shortest (1.4 months; n=226) in Q4 2018. Duration of use increased across all groups over the three year period.

CONCLUSIONS: This methodology presents a range of opportunities for programmatic action, while easing the burden of data management and analysis. Tracking these two indicators is important for impact-oriented planning and evaluation of activities for oral PrEP and future prevention products.

PEE1730

WHAT IS OUR COLLECTIVE IMPACT?: EVALUATING A COLLABORATIVE APPROACH TO ADDRESSING HIV DISPARITIES IN THE US SOUTH

I. Udoh[1], J. Fuega[1], J. Williams[2]
[1]ETR, Oakland, United States, [2]Junious Williams Consulting, Inc, Oakland, United States

BACKGROUND: The epicenter of the United States HIV/AIDS crisis lies in its 16 Southern states. The CDC estimates that while these Southern states account for 38% of the total US population, nearly 50% of all new HIV infections occur in the South. With its disproportionate impact on African Americans- 59% of all Black men who have sex with men and over 70% of Black women living with HIV reside in the South- high impact, multi-sectoral integrative approaches are necessary.

DESCRIPTION: The Collective Impact (CI) approach posits that large-scale social change requires broad cross-sector systematic collaboration, rather than individual intervention approaches. Through innovative long-term funding, Gilead is using an investment model to address the epidemic by strengthening program service availability and implementation capacity throughout the South. Using a mixed methods design, we are evaluating the collaborative efforts of the model using CI's "five core conditions": common agenda, shared measurement, mutually reinforcing activities, continuous communication, and backbone organizational support. Additionally, the evaluation design focuses on a sixth condition: Equity and inclusion.

LESSONS LEARNED: During the initial implementation phase, key partners jointly identified indicators to measure collaborative efforts. A brief survey drawn from CI tools was implemented with partners at the mid-point of the Initiative's three-year funding period along with in-depth interviews to capture themes and lessons regarding initiative startup and mid-point implementation. While there was strong alignment between partners on the common agenda and shared knowledge, more exploration is needed to understand how shared measurement, backbone support, and reinforcing activities support initiative goals. Additional early lessons have centered on managing timeline, funder expectations, organizational infrastructure and staffing.

CONCLUSIONS/NEXT STEPS: Collective Impact is a relatively new collaborative framework that is increasing in popularity as an approach to innovate social change. It has the potential to mitigate the challenges of launching and maintaining large scale HIV initiatives. It can support 1) understanding the role of partnerships, 2) selecting leading and supporting organizations, and 3) designing routinized reporting systems to monitor progress. CI has addressed complex issues including education, poverty reduction, and youth community development; this evaluation provides insights regarding adapting the CI approach to HIV collaborative initiatives.

EFFECTIVE APPROACHES TO LINKING POPULATION AND PROGRAMME DATA TO INFORM HIV PROGRAMMING

PEE1731

HIV RAPID TESTING TRENDS AMONG CLIENTS AGED 50 YEARS AND ABOVE IN UGANDA: A NEED FOR TARGETED PREVENTION SERVICES FOR THE ELDERLY

M. John Bosco Jr[1], L. Marvin[2], T. Geoffrey[1], M. Peter[1]
[1]Ministry of Health, STD/AIDS Control Program, Kampala, Uganda, [2]Clinton Health Access Initiative (CHAI), HIV Prevention, Kampala, Uganda

BACKGROUND: By 2017, 72.5% of HIV-positive adults living with HIV in Uganda knew their status. Of these, 75.4 % were females and 67.3% were males (UPHIA 2017). HIV prevention interventions usually focus on pediatric, adolescents and those aged below 49 years with less focus on the above 50 years old. We present HIV testing yield trend analysis for the elderly (>49 years) during a 30 months' period and suggest next steps aimed at optimizing HIV testing among this age category in Uganda.

DESCRIPTION: We reviewed HIV testing program data from the Uganda District Health Information System for the period January 2017 to June 2019 to compute HIV positivity rates among clients aged 50 years and above who received HTS services.

LESSONS LEARNED: A total of 1,421,227 clients aged above 49 years were tested for HIV of which 732,489 (52%) were females and 688,738 (48%) were males. The average HTS positivity rate (yield) was 3.2% (n=45,102 out of 1,421,227)) but higher among males compared to females (3.5% vs 2.9%). The baseline yield was at 3% for males and 2.8% for females. The end line yield was higher than the baseline for both gender categories (Males 3.3%, females 2.9%). A total of 4,99 (11%) clients were presumptive TB cases, 53% (n=2,633) were males and 47% (2,354) were females. Out of the total tested, 32% (23,5048 females and 214,641 males) were testing for the first time. Only 7.8% of all those that tested HIV positive had early stage disease defined as CD4 above 500 c/c (Males 8.1% (N=1,50) females (7.1%, n=1528).

CONCLUSIONS/NEXT STEPS: HIV positivity rates for elderly clients aged 50 years and above have been increasing over the past 30 months with males having a higher than average national yield of 3.3%. There is need to extend targeted HIV prevention services to the elderly as well just as it is to other age groups. We could however not establish whether the increasing positivity rate was related to new infections (incidence) or due to improved identification of the positive. Next

PEE1732

FEASIBILITIES AND DETERMINANTS OF MULTI-MONTH SCRIPTING (MMS) OF HIV ANTIRETROVIRALTHERAPY IN THAILAND

P. Saenyakul[1], C. Jeansuwannagorn[1], A. Bumrongkhiri[1], S. Chaitiamras[1], S. Duangmung[1], M. Avery[1], M. Sanguankwamdee[2], R. Vannakit[2]
[1]Family Health International (FHI 360), LINKAGES, Bangkok, Thailand, [2]U.S. Agency for International Development/Regional Development Mission for Asia, Bangkok, Thailand

BACKGROUND: Multi-month scripting (MMS) has been endorsed globally with the goal of improving ART retention. Under MMS guidelines, treatment-adherent clients virally-suppressed >6 months, without opportunistic infections or adverse drug reactions and are not pregnant, can be prescribed ART supplies of >1 month at each visit. Providing MMS reduce patient visits and congestion at ART clinics thus improving ART adherence. MMS service in Thai facilities has not been thoroughly investigated. This study aimed to explore the feasibilities and examine determinants of MMS.

METHODS: To examine MMS patterns, Thai Ministry of Public Health IRB approved to conduct a mixed-methods study using the convergent parallel design. Two-ways ANOVA was used to analyze the association of province, hospital, payment scheme, and populations with MMS drawing from 3,438 electronic medical records at 25 hospitals in 8 provinces between July 2018-October 2019. Structural focus group discussions (FGD) were conducted with multidisciplinary healthcare team of each hospital to explore the feasibility of MMS.

RESULTS: Approximately 82% of patients received 3-6 months of ART prescription (Median=91, min=15: max=387 days). The results revealed that MMS implementation was significant differences among provinces, levels and types of hospitals, payment schemes, and populations (p=<.001).

From FGDs, ARV drugs supply, procurement, and inventory systems and national policies of health plans and benefits were found to be main barriers to MMS services. Stock-out and/or limited stock have regularly occurred. Different health benefit schemes allowed for different ARV stocks and prescription periods resulted in limited MMS services.

CONCLUSIONS: In Thailand, MMS is widely employed with some geographic variance. MMS implemented across these ART sites revealed the relationship between longer MMS intervals and these determinants. This could be a starting point to improve MMS services. ARV procurement, inventory systems and restrictions of health benefit schemes, particularly social security scheme, need to be revisited and amended to secure MMS feasibility.

Determinant Variables	Determinant Categories	Mean	Std. Error	F	p Values
Provinces	1 Chonburi : 8 Samutprakarn	100.005 : 68.329	3.775 : 6.019	4.834	<.001
Level of Hospitals	1 Tertiary Hospital : 2 Secondary Hospital	94.890 : 83.976	2.957 : 2.399	8.216	0.004
Payment Schemes	1 Universal health coverage : 2 Other payments schemes	92.663 : 81.388	1.142 : 5.539	3.974	0.046
Type of Populations	1 General Populations : 2 Key Populations	86.998 : 94.026	2.553 : 2.173	4.393	0.036

PEE1733

PRACTICAL APPROACH TO ESTIMATING IMPACT OF ORAL PREP: SUCCESSFUL APPLICATION IN GUIDING PUBLIC SECTOR SCALE-UP IN SOUTH AFRICA

H. Subedar[1], E. Doyle[2], N. Shoko[2], O. Mosikare[2], Y. Pillay[1]
[1]South African National Department of Health, Pretoria, South Africa, [2]Clinton Health Access Initiative, Inc., Pretoria, South Africa

BACKGROUND: Practical tools for routinely estimating and planning against impact of oral PrEP programming on new HIV infections are lacking. We sought to develop a novel methodology for setting and evaluating impact-oriented PrEP targets using routinely collected M&E inputs and geography- and population-specific epidemiologic data to guide national public sector scale-up planning in South Africa.

DESCRIPTION: Facility catchment population and district HIV prevalence were used to estimate HIV negative individuals for 3,138 facilities. Four risk strata were assigned to each facility's age and sex groups based on district incidence rates. Demand generation and testing targets were set according to risk strata. PrEP initiation targets were set using quarterly programmatic uptake trends as a baseline and applying a percent adjustment according to risk strata. PrEP initiation targets and anticipated duration of use were used to estimate facility-level commodity needs. Relative impact of each facility's age and sex group was estimated using a formula that incorporated programmatic data, district-level incidence, and PrEP initiation targets (Figure 1). Relative impact factors were aggregated into one composite score per facility and ranked. Facilities with the highest relative impact in each sub-district in the country were prioritized to begin implementation in Phase I to maximize impact and equitable access (n=240). Planned order of implementation subsequently followed the relative impact rank for outstanding facilities.

[Figure 1. Formula for estimating relative impact on primary infections]

LESSONS LEARNED: Facility-level target setting by age and sex for demand generation, testing, and PrEP initiations guided robust public sector scale-up planning in South Africa. The methodology developed enables impact-oriented facility prioritization, quantitative linkage between annual targets and programmatic impact, and routine tracking using M&E indicators.

CONCLUSIONS/NEXT STEPS: This approach to measuring impact of oral PrEP can be used to track progress of national scale-up in South Africa using routine indicators, as well as create a platform for comprehensive evaluation and prioritization of HIV prevention services.

MONITORING AND REPORTING IN THE SDG ERA

PEE1734

USING A MIXED METHODS APPROACH FROM QUALITY MANAGEMENT TO ASSESS THE IMPLEMENTATION OF ART CARE IN A REAL-WORLD PUBLIC RURAL UGANDAN SETTING

F. Scheibe[1], P. Waiswa[2], F. Neuhann[1], ARVMAC Study Group
[1]Heidelberg University, Heidelberg Institute of Global Health, Heidelberg, Germany, [2]Makerere University, School of Public Health, Kampala, Uganda

BACKGROUND: More than 10 years after the beginning of Scale-up and decentralization of Antiretroviral Therapy (ART) in Sub-Saharan Africa, there is ongoing need for assessment of the quality of services offered in public ART-programs outside of research activities or external funding. We applied a mixed-methods approach coming from quality management research in order to identify possible bottlenecks or weaknesses within a public ART program in a rural Ugandan district in 2009.

DESCRIPTION: Using a convergent parallel and an exploratory sequential study design, all ART providing health facilities in the district were assessed using both qualitative methods as observations or in-depth-interviews with key informants, semi-qualitative interviews with patients and quantitative methods by digitization of paper-based patient files and registers for a retrospective cohort-analysis. To enhance validity, findings were then triangulated. The sequential study design allowed to adapt research tools during the study.

LESSONS LEARNED: By triangulation of several methods we identified Antiretroviral (ARV) drug-shortages and attrition to the program to be some of the main challenges in the district: Reviewing ARV logs showed that first-line non-nucleoside reverse transcriptase inhibitor was out of stock at some facilities up to 36,2% of time during 12 months prior study. ARV stock-out-time was the highest for facilities with the highest rates of ART initiation among their patients and with the best rates of retention in care in the retrospective cohort analysis. Key informants at all facilities reported drug shortages as a main problem. Out of 149 interviewed patients, 34(22,8%) indicated a previous treatment interruption and 16(47,1%) out of them stated a stock-out at the facility to be the reason for it. The research team observed how ARVs were not available on the day of visit and how health care workers had to improvise.

CONCLUSIONS/NEXT STEPS: In the face of widely improved access to ART, using mixed-method approaches and triangulation of results allows comprehensive assessment of the quality of ART at facility level and includes the perspective of the affected communities. To achieve the "90-90-90"-goals and ultimately epidemic control, we recommend the use of mixed-method approaches for early and comprehensive identification of bottlenecks and the development of responsive models of ART delivery.

PEE1735

CONTRIBUTION OF COMMUNITY SOCIAL WELFARE PLATFORMS TO PEDIATRIC TREATMENT OUTCOMES ALONG THE CONTINUUM OF CARE IN TANZANIA

A. Athman[1], J. Charles[1], E. Jere[2], A. Exavery[1], T. Mbwambo[1], A. Barankena[2]
[1]Pact Tanzania, Monitoring, Evaluation and Research, Dar es Salaam, Tanzania, United Republic of, [2]Pact Tanzania, Program, Dar es Salaam, Tanzania, United Republic of

BACKGROUND: Extending health systems to the community is an approach to improve HIV treatment outcomes and reduce new HIV transmissions. In Tanzania, integration of HIV actions into the community social welfare system was explored as a complementary opportunity to improve obstacles to optimal pediatric HIV outcomes.

METHODS: A PEPFAR-support Orphans and Vulnerable Children (OVC) project in Tanzania collected pediatric ART data from October 2017 to October 2019 in 81 councils. Lay community social welfare volunteers supported HIV testing referral, linkage to care and test-and-treat services, and ART retention. The analysis tracked three cohorts of OVC aged <18 for 24 months: those on ART at enrolment; those who had dropped from ART care; and those who had unknown status, and after risk assessment and referral, were newly diagnosed. Descriptive statistical analysis was used to assess the outcomes.

RESULTS: The project enrolled 6,634 HIV+ OVC (51.7% female; mean age of 11.2 years). 55.4% were in-school. Disclosure counselling resulted in 61.6% of OVC aged 8+ knowing their HIV status. 82.6% were successfully linked to a support group for PLHIV; Overall, 99.7% (6,612) of the OVC were engaged in HIV care, with a 99.3% (6,588) retention

rate at 24 months. Of the 6,634 the 1,909 OVC on ART at enrollment had a 99.4% retention rate after 24 months. Of the 611 OVC that had discontinued ART at the time of enrollment, volunteers linked 98.7% to ART, with a 95.4% ART retention rate after 24 months.
100% of the 4,114 OVC who were newly-diagnosed HIV+ after enrollment were linked to care with a 99.6% (4,098) retention rate after 24 months. Volunteers applied family-centered case management methods (average of 16 monthly contacts over 24 months) and provided escorted referrals, linked caregivers to economic strengthening, supported health insurance registration, and worked across social welfare and health facility structures for continuum of care.
CONCLUSIONS: Community social welfare platforms that integrate HIV actions improve pediatric case finding, lost to follow up tracking, and treatment retention. Investment in social welfare staffing, training, and expansion of community systems can contribute to addressing non-health systems-related obstacles along the HIV continuum of care.

PEE1736

PHYSICAL OR MENTAL DISABILITIES AND THE UPTAKE OF ANTIRETROVIRAL THERAPY AMONG HIV POSITIVE CAREGIVERS OF ORPHANS AND VULNERABLE CHILDREN IN TANZANIA

A. Exavery[1], A. Barankena[1], J. Charles[1], E. Kuhlik[2], E. Jere[1]
[1]Pact, Dar es Salaam, Tanzania, United Republic of, [2]Pact, Inc., Washington, DC, United States

BACKGROUND: Uptake of antiretroviral therapy (ART) is crucial for better health outcomes among people living with the human immunodeficiency virus (PLHIV). People with disabilities are particularly vulnerable to contracting HIV due to sexual abuse and exploitation, among others. They are also limited in terms of access to information, testing and treatment. However, only a few studies or interventions focus on this population, possibly due to lack of appropriate data. This study compares uptake of antiretroviral therapy among disabled and non-disabled HIV positive caregivers of orphans and vulnerable children.
METHODS: Data are from the community-based, PEPFAR-funded project that aims to scale up the uptake of HIV/AIDS and other health and social services by orphaned and vulnerable children (OVC) and their caregivers. HIV positive caregivers of OVC who were enrolled in the project during January 2017 – June 2018 were included in this analysis. The outcome variable was ART status (either using or not), which was enquired of each OVC caregiver living with HIV. Physical or mental disability was the main independent variable. Data analysis involved multivariate analysis using random-effects logistic regression to study ART uptake by disability status.
RESULTS: 74,999 caregivers living with HIV with mean age of 44.4 years were analyzed. Of these, 1.5% (n = 1,127) were physically or mentally disabled. Overall ART uptake was 96.4%. ART uptake was 93.4% and 96.5% among disabled and non-disabled caregivers respectively ($p<0.001$). In the multivariate analysis, disabled caregivers were significantly (42%) less likely than those not disabled to be on ART (OR = 0.58, 95% CI 0.45–0.76). This observation was adjusted for place of residence, food security, sex, age, marital status, education, wealth quintile, health insurance, and village co-residence.
CONCLUSIONS: The degree of ART uptake among the HIV positive caregivers was notably high (96.4%), but lower among those with disabilities compared to those without. Service integration such as mental health and HIV treatment to address disabilities will likely enhance ART uptake among the disabled. There may be physical and logistical limitations to ART access among disabled PLHIV, thus a need for programs to target the disabled with interventions to improve their ART uptake.

LAWS AND POLICIES ON REPRODUCTION (INCLUDING COERCED STERILIZATION AND ABORTION)

PEF1735

SEXUAL AND REPRODUCTIVE HEALTH RIGHTS VIOLATIONS EXPERIENCED BY WOMEN LIVING WITH HIV IN THE ASIA PACIFIC

S. Banjade Shahi[1], N. Mokhtar[2]
[1]*International Community of Women Living with HIV Asia Pacific (ICWAP), Bangkok, Thailand,* [2]*International Community of Women Living with HIV Asia Pacific (ICWAP), Women Living with HIV, Bangkok, Thailand*

BACKGROUND: The Asia Pacific region boasts two countries that have been validated by the WHO for the elimination of mother to child transmission of HIV (EMTCT), Thailand in 2016 and more recently in 2018, Malaysia. Yet despite advances in PMTCT science, women living with HIV in the region report significant challenges in accessing services and securing their SRHR persist including stigma discrimination and human rights abuses including coercive practices such as forced and coerced sterilization.

DESCRIPTION: Coerced or forced sterilization of women living with HIV is a pervasive global phenomenon and has been reported by women living with HIV and documented along with other coercive practices in more than 30 countries including multiple countries in the Asia Pacific Region, notably Thailand, Malaysia and recently in Indonesia. The practice occurs within a systemic pattern of discrimination and violations of sexual and reproductive rights experienced globally by women living with HIV. Ending discrimination and human rights abuses against women living with HIV and particularly those seeking to have children and participating in PMTCT programs is essential to retaining women living with HIV in care and in meeting global HIV and maternal health targets.

LESSONS LEARNED: ICWAP and our partner networks of women living with HIV have been documenting these experiences of stigma, discrimination and human rights abuses with the goal of articulating a set of strategies to address these issues. This session seeks to explore human rights violations such as coercion and denials of agency and bodily autonomy from the perspective of women living with HIV with the goal of articulating strategies to secure the rights and well-being of women living with HIV in care and in meeting global HIV and maternal health targets.

CONCLUSIONS/NEXT STEPS: ICWAP organized 3 seres of leadership school. The training was to expand and develop a core cadre, attached to ICWAP to regional and national levels who are well-informed skilled and positioned to represent to lead a diverse group of women living with HIV to various decision-making planning processes. Supportive policies must be in place to continue evidence-based advocacy and mostly resources must be allocated to have ethical research and reduce critical violations.

PEF1736

THE LACK OF ACCESS TO THE RIGHT TO CHOOSE AND THE SEXUAL AND REPRODUCTIVE HEALTH AND RIGHTS OF THE YOUNG WOMEN LIVING WITH HIV

Y. Chan[1]
[1]*International Youth Alliance For The Family Planning -IYAFP-, Guatemala, Guatemala*

BACKGROUND: In Guatemala the 90% of the new cases people living with HIV acquired the virus by sexual transmission for the lack of access of the Comprehensive Sexual Education -CSE-. In 2017 the 40% of the new cases of HIV were in people under 30 years old.
Currently the access of the sexual and reproductive rights it is limited for legislative initiative called “Protection of the life and family”, specifically with young people living with HIV because the health personnel do not provide the information in the health services.

DESCRIPTION: The situation in Guatemala of the young women living with HIV i the health system do not let that the young women to decide of their own body.
Currently the health system does not allow young women decide how many children they want to have. When a women is pregnant and is HIV+ the health system does the sterilization process without their consent.
In Guatemala with the support of AMUGEN we have specific education project that looks to guarantee the access of SRHR and access to the ARV as a prevention strategy working in different communities including indigenous young women with HIV.
We I dentified 4 cases of young women with HIV who where sterilized.

LESSONS LEARNED: 1. The young women living with HIV did not know that they have sexual and reproductive rights and they normalized that the health personnel decided for their own bodies.
2. The young key population does not feel comfortable talking about their sexuality with their doctors.
3. The discrimination limited to enjoy their sexuality.
4. When a women know about U=U they feel more relax about the vertical transmission

CONCLUSIONS/NEXT STEPS: 1. Is important that young people with HIV know more about the target 90-90-90
2. The people living with HIV ignore that they have human rights.
3. The SRHR is necessary to all young people no matter their serologic status.
4. It is necessary that civil society did not limit the young leadership in LATAM.

LAWS AND POLICIES ON HIV TRANSMISSION

PEF1737

MEN WHO HAVE SEX WITH MEN LIVING IN STATES WITH HIV-SPECIFIC CRIMINALIZATION LAWS REPORT HIGH COMMUNITY STIGMA – NHBS, 2017

A. Baugher[1], A. Whiteman[1,2], W.L. Jeffries IV[1], T. Finlayson[1], C. Wejnert[1], for the NHBS Study Group
[1]Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Atlanta, United States, [2]Oak Ridge Institute for Science and Education, Oak Ridge, United States

BACKGROUND: In 2017, 36 states had laws penalizing persons with HIV (PWH) for sexual or no-risk behavior (e.g., spitting). Research shows these laws do not impact sexual risk behaviors or diagnosis rates. Citizens likely are unaware of these laws; we do not expect direct behavioral effects. However, laws reflect states' values and may mirror community attitudes towards PWH. Understanding how structural factors relate to stigma is important for stopping HIV stigma.
METHODS: National HIV Behavioral Surveillance used venue-based sampling methods to interview men who have sex with men (MSM) in 23 U.S. cities from June-December 2017. Using Center for HIV Law and Policy reports, we categorized states' HIV-specific laws as of June 2017. We compared MSM's perceptions of community attitudes towards PWH between MSM living in states with versus without HIV laws. We obtained adjusted prevalence ratios using log-linked Poisson models assessing the relationship between law and four community stigma attitudes (discrimination, rights, friendship, punishment), which we then compared between black MSM in states with versus without laws.
RESULTS: Two-thirds of MSM lived in states with HIV-specific laws. MSM in states with laws were more likely to report black race (38% versus 15%), poverty (23% versus 12%), or incarceration (25% versus 19%). Multivariable models found laws were related to perceived community beliefs that PWH "got what they deserved" (aPR=1.13, 95% CI: 1.03-1.24), but not other attitudes. Compared to black MSM in states without laws, black MSM in states with laws were more likely to believe persons in their community would discriminate against PWH (64% versus 50%), not support PWH's rights (25% versus 16%), not be friends with PWH (24% versus 13%), and believe HIV was deserved punishment (32% versus 22%).
CONCLUSIONS: MSM in states with HIV laws were disproportionately from marginalized groups. Laws were related to perceived community attitudes that HIV was deserved punishment; understanding specific stigma attitudes can inform interventions. Although black MSM reported high community stigma overall, stigma was significantly higher for black MSM in states with HIV laws. States may consider repealing or reforming HIV laws and focusing on effective prevention efforts to End the HIV Epidemic.

PEF1738

IMPROVING THE APPLICATION OF THE LAW: UPDATING GUIDELINES FOR PROSECUTORS IN ENGLAND AND WALES REGARDING SEXUAL TRANSMISSION OF INFECTION

D. Gold[1], C. Douglas[1], K. Smithson[1]
[1]NAT (National AIDS Trust), London, United Kingdom

BACKGROUND: In England and Wales it is possible to be prosecuted for the sexual transmission of infection under the Offences Against the Person Act 1861 or the Criminal Attempts Act 1981. After the first prosecutions in 2003, National AIDS Trust (NAT) successfully advocated for legal guidance for prosecutors and worked with the Crown Prosecution Guidance (CPS) to develop this.
DESCRIPTION: In 2018 NAT requested that the guidance be updated. In January 2019 the CPS shared a draft of their revised guidance with NAT, who then coordinated a joint response from NAT and other key stakeholders. This successfully ensured that the new guidance reflects medical developments such as Undetectable=Untransmittable and clinical guidance.
Developments in case law have led the CPS to take the view that HIV/STI status deception may be capable of vitiating consent to sex. NAT is concerned that this could result in people who lie about their HIV status being prosecuted for rape or sexual assault, even with safeguards used and no transmission occurring. NAT prepared a briefing articulating legal, policy and public health arguments against this position, and presented it at a meeting with the CPS. As a result the CPS have added several caveats, but we still believe their position to be unacceptable and discussions are ongoing.
LESSONS LEARNED: The successes we have had in improving the guidance demonstrate the importance of long-standing proactive engagement, relationship-building and collaboration. Collaborating with a range of key stakeholders including clinicians and lawyers enabled NAT to leverage wider authority and expertise.
However, the issue of HIV status deception has illustrated the implications for HIV of legal developments in related but not directly transferable areas. Confidence in our understanding of the law and persistence in making our arguments heard has been crucial in ensuring ongoing engagement on this issue.
CONCLUSIONS/NEXT STEPS: The updated guidance will help to ensure that prosecutions for reckless or intentional transmission are conducted in a way that minimises harm to both individuals and the wider community.
Regarding the issue of HIV status deception, possible next steps include securing parliamentary engagement, pro bono legal opinions, and further representations from local government and public health bodies.

PEF1739

CRIME AND PUNISHMENTS: DEPORTATION PROCEEDINGS AGAINST PEOPLE CONVICTED OF CRIMINAL TRANSMISSION OF HIV

A. Stratigos[1]
[1]HIV/AIDS Legal Centre, Surry Hills, Australia

BACKGROUND: A significant portion of people convicted of HIV transmission in Australia are not Australian citizens. Due to not holding citizenship, those convicted of serious criminal offences (which includes facing a prison term of 12 months or more), are at risk of hav-

ing their visas cancelled and being removed from Australia. The HIV/AIDS Legal Centre (HALC) has represented a number of these clients in both their criminal and subsequent immigration proceedings to assist these clients in preventing their removal from Australia.

DESCRIPTION: Where a person is not an Australian citizen and commits a criminal offence they are at risk of detention and removal from Australia. In two recent case studies of people with HIV convicted of HIV transmission, following the completion of their custodial sentences steps were then taken to cancel their visas and place them into immigration detention. Both clients had their visas cancelled and had to take steps to appeal the decisions. Part of the reason for the cancellation was the perception of ongoing risk to the Australian community. Neither client had been convicted of intentionally transmitting HIV to their sexual partner.

HALC continues to represent one of the clients mentioned and the other has now exhausted all appeal options.

LESSONS LEARNED: There are often many and varied reasons for HIV non disclosure and, from HALC's experiences, following criminal and public health interventions it is unlikely that a person with HIV would continue to place their sexual partners at risk of contracting HIV. Decision makers in migration proceedings appear to be unwilling to accept that a person with HIV would no longer place their sexual partner at risk of HIV transmission as the decision makers note in their decisions that they there remains a risk to the community.

CONCLUSIONS/NEXT STEPS: The outcomes of these cases demonstrates the need for ongoing advocacy and law reform in the removal of offences for HIV non-disclosure, exposure and transmission, except where actual intent can be established to a criminal law standard. The cases also demonstrate the ongoing need for continued robust representation of those, often vulnerable migrants, who are facing visa cancellation.

PEF1740

DECRIMINALIZATION OF HIV TRANSMISSION: ADVOCACY EXPERIENCE OF THE CIVIL SOCIETY COALITION FOR THE DECRIMINALIZATION OF HIV IN NIGER

k. Ibrahim[1], A. Aboubacar[2], R.A. Mariama[3]
[1]Association des Jeunes Juristes du Niger, Niamey, Niger, [2]Reseau Nigérien des Personnes Vivant avec le VIH (RENIP+), Niamey, Niger, [3]Association BALLAL, Niamey, Niger

BACKGROUND: To effectively fight against HIV, Niger adopted Law No. 2007-08 of April 30, 2007 related on HIV prevention, care and control. This law included problematic provisions, including the criminalization of exposure, HIV transmission, and the non-disclosure of HIV to the sexual partner. Actually, PLWHIV continue to be victims of the application of the provisions criminalizing the transmission of HIV through several criminal prosecution cases in 2017.

DESCRIPTION: In June 2018, 13 civil society organizations created the "National Coalition for the Decriminalization of HIV in Niger". This one benefited from the technical and financial support of HIV JUSTICE WORLDWIDE. Its advocacy objectives, by 2021, are to : repeal of offenses criminalizing exposure and transmission of HIV ; research and disseminate reliable and convincing data on the impact of HIV criminalization on access to HIV-related services. Since its creation, the Coalition has carried out the following activities : National workshop for consulting civil society stakeholders on the exposure, transmission and non-disclosure of HIV in Niger ; The development of the Memorandum of December 20, 2018 entitled "exploring ways and means to resolve the problems of legal proceedings against people living with HIV in order to reduce to zero the new infections, deaths and discrimination linked to AIDS" ; Organization of several advocacy meetings during the "zero discrimination" day (March, 2019) for public decision-makers and partners.

LESSONS LEARNED: · judicial police officers and magistrates have to exercise greater caution when considering a criminal prosecution, and in particular, carefully assess the latest scientific data on the risks of transmission and the consequences of the infection;

· National AIDS Control Program need a comprehensive assessment of the application of criminal legislation on the transmission, exposure and non-disclosure of HIV status in order to measure its impact on the effectiveness of national response.

CONCLUSIONS/NEXT STEPS: The criminalization of HIV transmission undermines public health efforts and does not take into account the reality of PLWHIV and especially women who are not always able to disclose their HIV status without fear of reprisals or violence, or to impose the wearing a condom. The threat of possible criminal prosecution only increases their vulnerability.

PEF1741

POPULATION-LEVEL IMPACT OF A POLICE EDUCATION PROGRAM ON HIV RISK AMONG PEOPLE WHO INJECT DRUGS IN TIJUANA, MEXICO

J. Cepeda[1], L. Beletsky[1], D. Abramovitz[1], S. Strathdee[1], J. Arredondo[2], G. Rangel[3], N. Martin[1]
[1]University of California, Medicine, San Diego, United States, [2]Centro de Investigación y Docencia Económicas, Aguascalientes, Mexico, [3]El Colegio de la Frontera Norte, Tijuana, Mexico

BACKGROUND: People who inject drugs (PWID) often report negative interactions with police that could elevate their risk of acquiring HIV. Some interactions can occur proximally on the causal pathway (syringe confiscation leading to syringe sharing) or distally (arrest outside methadone providers). To align policing with public health, from February 2015 – May 2016, we trained over 1,800 police officers in Tijuana on occupational safety, drug policy reforms, and epidemiology of HIV and harm reduction services. We assessed how the training could have impacted the HIV risk environment in a parallel cohort of PWID in Tijuana.

METHODS: We recruited 589 PWID by street outreach among whom 39% were female and 70% reported receptive syringe sharing at baseline. Data on police interactions were limited to visits 21 months before, 15 months during and 18 months after the training. We adopted an interrupted time series design to assess temporal trends in police interactions reported by PWID. We partitioned data into 3-month intervals which were classified into 3 periods: pre-training (7 intervals), training (5 intervals), and post-training (6 intervals). We conducted mixed effects logistic regression to estimate the mean predicted probability of the outcomes for each 3-month time interval and used these values in segmented regression to estimate the immediate change in probabilities of the outcomes from one period to the next and the change in trend within one period and the next.

RESULTS: Compared to the pre-training period, perception that participants would be arrested for carrying new syringes declined significantly during the training period (p=0.03). Further, we observed a significantly decreasing trend in the probability of syringe sharing (p=0.02) during the training period, which continued to decline in the post-training period (p=0.03). We also detected an increasing trend in the probability of accessing methadone during the training

period, which marginally increased in the post-training period.

CONCLUSIONS: Police trainings that integrate public health concepts could be a novel structural intervention to reduce HIV risk among PWID. Police officials should ensure that street-level officers understand how their behaviors impact health of PWID and have the capacity to refer PWID to harm reduction programs.

PEF1742

REMOVING LEGAL BARRIERS TO ACCESSING HIV SERVICES IN MALAWI: IMPACT OF REGIONAL- AND NATIONAL-LEVEL INTERVENTIONS

L. Ferguson[1], K. Juma[2], D. Patel[3], D. Owolabi[3], A. Saha[3], K. Zacharias[1], A. Chimbiri[4], S. Gruskin[1]
[1]University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States, [2]APHRC, Nairobi, Kenya, [3]UNDP RSCA, Istanbul, Turkey, [4]UNDP Malawi, Lilongwe, Malawi

BACKGROUND: Building on the work of the Global Commission on HIV and the Law, and in order to promote an enabling environment for achieving the 90-90-90 targets, UNDP has supported regional- and national-level work on removing legal barriers to accessing HIV services in sub-Saharan Africa. Covering over 20 countries, this work consists of regional-level capacity building for duty-bearers and rights-holders from the different countries and in-country activities tailored to local realities.

DESCRIPTION: In 2019/20, we evaluated the impacts of this work through a review of project documents and key informant interviews with stakeholders including civil society representatives, government officials, and UNDP staff, and conducted an in-depth case study in Malawi.

LESSONS LEARNED: Participation in regional spaces empowered national-level stakeholders in their country level work. A participatory legal environment assessment (LEA), jointly owned by government and civil society, served as the starting point and the resulting document, providing an overview of the strengths and weaknesses of HIV-related national laws and policies, has served as a cornerstone for subsequent activities. For example, national advocacy efforts informed by the LEA, and participation by the Chair of the Parliamentary Committee on HIV in regional activities, were key to shaping a revised HIV law to better align with international human rights law. The new law has led to the reform of the institutional framework for the national HIV response. Judges participated in regional judges' fora where they could request information on HIV-related science, discuss lived experiences with key populations' representatives and hear about how legal issues were being addressed across the region.

Lawyers from across the region took part in joint training. After one such training, and with technical support from regional partners to create a strong case, a lawyer chose to appeal the conviction of a woman under Malawi's law criminalizing HIV transmission. The presiding judge had attended regional judges' fora and, drawing on a firm understanding of HIV transmission dynamics, overturned the original ruling.

CONCLUSIONS/NEXT STEPS: A mix of regional and national level activities allows for tailoring of activities to national contexts while also providing space for peer networking and support where 'difficult' issues might more easily be discussed.

LAWS AND POLICIES ON EMPLOYMENT, WORK AND RESIDENCE PERMITS

PEF1743

COLLABORATING WITH REGULATORS TO ACHIEVE SYSTEMIC CHANGE FOR PEOPLE LIVING WITH HIV: A CASE STUDY OF EMPLOYMENT DISCRIMINATION IN LONDON'S SOCIAL CARE SECTOR

D. Gold[1], R. Hayes[1]
[1]National AIDS Trust, London, United Kingdom

BACKGROUND: The United Kingdom's Equality Act 2010 makes it unlawful to ask job applicants questions about their health which are not directly relevant to the job. This should prevent discrimination against applicants living with HIV. However, employers' limited knowledge of equality law and a lack of enforcement by regulators means that some employers continue to ask about HIV status during recruitment. We undertook a project to determine the extent to which illegal pre-employment health questionnaires were being used by employers and challenge their use.

In order to manage the scope of the project, we focused on the social care sector in London. Our rationale was twofold: London has the greatest number of people living with HIV compared to other cities, and we had anecdotal evidence that social care providers were asking job applicants about their HIV status.

DESCRIPTION: We reviewed the websites of 1000 social care providers and identified 71 providers using unlawful health questions in their online application forms. We contacted them, highlighting their breach of legislation and asking them to change their practice. We contacted the Equality and Human Rights Commission (EHRC) – the regulator of the Equality Act – and the Care Quality Commission (CQC) – regulator of social care – to draw their attention to this issue. The EHRC agreed to us referring providers who did not respond or refused to remove unlawful health questions to them for further investigation.

LESSONS LEARNED: 45 providers responded positively, and we supported them to modify their application forms. We also shared guidance on how to improve employment and social care for people living with HIV. The remainder were referred to the EHRC.

With the EHRC and the CQC, we developed guidance on pre-employment health questions for CQC inspectors, including how to refer providers to the EHRC.

We learned that gathering evidence of widespread unlawful behaviour is key to gaining the support of regulatory bodies. Their support strengthens challenges to organisations behaving unlawfully and enables systemic change to reduce HIV discrimination.

CONCLUSIONS/NEXT STEPS: Legislation alone is insufficient to prevent HIV discrimination. Civil society should collaborate with regulators to ensure effective enforcement of the law and increase understanding of HIV

AGE OF CONSENT LAWS REGULATING ACCESS TO HIV TESTING AND TREATMENT AND OTHER SERVICES

PEF1744

A CRITICAL ANALYSIS OF THE FALLING AGE OF INITIATION AMONG THE INJECTING DRUG USERS AND THE PROGRAMMATIC RESPONSE IN MANIPUR, INDIA

K. Kamkara[1]
[1]*Vrije, KIT Development Policy & Practice, Amsterdam, Netherlands*

BACKGROUND: Manipur is the first pioneering state in India to implement Harm Reduction (HR) in India. Manipur lies adjacent to the Golden Triangle . Manipur has the third highest rate of HIV Sero-prevalence in India. There are about 32,000 injecting drug users (IDUs) in Manipur (Quest 2011). The National AIDS Control Organisation (NACO) classifies Manipur as high-HIV prevalence state. The IDUs in Manipur contributes to 50% of the total HIV infection (NACO HIV epidemiological surveillance 2005).

DESCRIPTION: Literature review using the modified conceptual framework adapted from Andersen and Newman to interrogate the literature and My 7 years of my working experience in Manipur for implementing Harm Reduction (HR) project with Project ORCHID funded by (BMFG) . Project ORCHID works in selected district of 2 states in north eastern state in India, Manipur and Nagaland, with 31 (NGOs). With the target of 18,000 (IDUs), 4000 (FSW), and 1450 n (MSM)

LESSONS LEARNED: The age of initiation of injecting drug use is decreasing in Manipur. Adolescent IDUs are more vulnerable than adult IDUs, as consequences of legal obligation and non-availability of Harm reduction (HR) services No HR services in India below 18 years. About 94.5% of first injection was usually administered by adult IDUs so , It increases in sharing of needle and syringes, paraphernalia and unsafe sex which increase in HIV, HCV, STIs, overdoses, abscess and premature mortality. While HR for adult IDUs has proved to be effective in Manipur, it has in decrease in HIV prevalence among adult IDUs from 76% in 1997 to 12.8% in 2011.

CONCLUSIONS/NEXT STEPS: Acknowledging the decrease in age of initiation and vulnerability.The magnitudes of barrier to utilisation of HR services for adolescent IDUs can facilitate early intervention of HIV prevention programs. During my research field findings there is no adolescent IDU HR services in the world. As if we are waiting for the adolescent IDUs to get infected with HIV/AIDS and other BBVs . Therefore, the International, National and state Government should urgently revise and update the current HR policies to allow adolescents as beneficiaries, conduct size estimation for adolescents IDUs,establish adolescent friendly centres, strengthened referral and linkages with other programs.

PEF1745

PROXY CONSENT AND CASE MANAGEMENT OF ADOLESCENTS LIVING WITH HIV (ALHIV): THE CASE OF ILOILO CITY, PHILIPPINES

R.J. Figuracion[1], M.L. Diones[2], K.V. Homena[1], J.C. Montelibano[1], S. Alayon[3]
[1]*Family Planning Organization of the Philippines (FPOP) Iloilo Chapter, HIV Program, Iloilo City, Philippines,* [2]*Family Planning Organization of the Philippines (FPOP) Iloilo Chapter, Iloilo City, Philippines,* [3]*Southeast Asian Fisheries Development Center, Aquaculture Department, Tigbauan, Iloilo, Philippines*

BACKGROUND: The Philippines is one of the countries with the fastest-growing HIV epidemic in the World in 2008-2018. The Philippine AIDS Prevention and Control Act of 1998 (RA 8504) requires minors to secure parental consent when undergoing an HIV test. To address the multi-faceted issue of HIV, UNICEF, in partnership with other organizations, advocated the proxy consent protocol for HIV testing in 2016. Government agencies at the national level such as the Department of Health (DOH), Department of Social Welfare and Development (DSWD), National Youth Commission (NYC), Department of Justice (DOJ), and the Council for the Welfare of Children (CWC) endorsed the protocol.

DESCRIPTION: A pilot project of the proxy consent was conducted in the city of Iloilo by the Family Planning Organization of the Philippines (FPOP). In 2016-2018, of the 135 minors tested by FPOP, four were found positive. The Iloilo City Information and Service Delivery Network (IISDN) was established through lobbying at the Local Government Unit of Iloilo City. The paper will discuss the model to integrate adolescent sexual and reproductive health services towards HIV prevention. HIV issues were viewed from both the medical and social perspectives. An evidence-based adolescent HIV programming approach to prevention and treatment was implemented.

LESSONS LEARNED: With this model, working closely with the government agencies, NGOs, development partners, and peer educators, and integrating health, psychosocial, legal and protection, and financial support, service delivery to adolescent health, especially for minors living with HIV, is attainable. The paper will also describe how the evidence gathered in 2016-2018 through the pilot testing became instrumental in lobbying to lower down the age of consent. Under the new law (RA 11166 or the Philippine HIV and AIDS Policy Act of 2018), minors aged 15 to 17 years old can now undergo an HIV test without parental consent.

CONCLUSIONS/NEXT STEPS: The model is a leap toward realizing an age-inclusive HIV programming and that can be replicated in other cities or regions. The lessons learned in this case could be used by other cities embarking on a similar program.

HUMAN RIGHTS VIOLATIONS AGAINST PEOPLE LIVING WITH HIV

PEF1746

COMMUNITY EFFORTS SUCCESSFULLY LEADS THE POLICY CHANGE

A. Jahan[1,2]
[1]Bandhu Social Welfare Society, Prevention and Care for HIV, Dhaka, Bangladesh, [2]Directorate General of Health Services, National AIDS/ STD Control Programme, Dhaka, Bangladesh

BACKGROUND: People living with HIV in Bangladesh often face stigma and discrimination from the family, society, work place and also accessing health, education and legal services. Stigma Index report UNAIDS 2017, 47% HIV+ experienced at least one event of stigma and discrimination, 53% refused health care services. A fact is presenting here the scenario. In August 2019, a nursing student identified HIV positive during the blood donation campaign in his institution, a confirmatory test was performed by the authority forcefully. The student assaulted in front of faculties and students; a medical board of the nursing institution recommended to suspend the student as he identified HIV positive moreover MSM. The student received a letter 4 days before the final exams from the institution stopping him all kinds of academic activities. Education is basic human rights which every human being is entitled. The student was referred to Bandhu Social Welfare Society (Bandhu) for help, as the organization works for HIV prevention and human rights among MSM and Transgender.
DESCRIPTION: Bandhu visited the hospital authority in order to secure the victim's participation in the final exam. Activities were undertaken to change the mindset of the hospital authority: organized meeting referring the national strategy, responses of HIV prevention and treatment, engaged National AIDS/STD Program and national human rights commission, Facebook posting for creating awareness and to stand beside the student as a result 20 people from CSO and community leader visited the college and protested, conducted advocacy meeting with teachers of the institution for changing institutional policy towards PLHIV, all event were organized in Sept-Oct, 2019.
LESSONS LEARNED: The hospital authority withdrawn the suspension letter and gave permission sitting the exam. Continuous advocacy efforts lead to policy change. Correct information can replace the myths and misconceptions. Social media (Facebook) also helped to create a pressure from the civil society.
CONCLUSIONS/NEXT STEPS: The national AIDS/STD program took the responsibility to conduct series of advocacy meetings and awareness amongst the private medical college hospitals and educational institution to create awareness in the country as the national program has its main role of HIV prevention and treatment in Bangladesh.

PEF1747

MISSION (IM)POSSIBLE: HOW COMMUNITY OF PLHIV SHALL CHANGE PATENT NATIONAL LEGISLATION ON ACCESS TO TREATMENT IN UKRAINE

K. Rivera[1], M. Rovinskyi[1], Y. Chechotkina[1], O. Kolotukha[1], N. Smolianets[1], M. Trofimenko[2]
[1]CO "100% LIFE", Communications, Kyiv, Ukraine, [2]CO "100% LIFE", Advocacy, Kyiv, Ukraine

BACKGROUND: The total budget of centralized purchases in Ukraine in 2018 amounted to $ 155.710 million, of which $ 77,190 million is spent on drugs protected by patents.
It is estimated that 238, 000 people are living with HIV (PLHIV) in Ukraine. The total state budget for the purchase of ARVs in 2018 was $24 million.
But for only one drug, Aluvia, Ukraine annually spent $12, 690, 000, covering only 27, 000 patients out of 90, 000 PLHIV receiving ARV.
Since 2015, CO 100% LIFE has been fighting to expand access to treatment and market access for generic HIV drugs.
DESCRIPTION: To increase access to generic drugs on the Ukrainian market, CO 100% LIFE advocates for changes in patent law in Ukraine. To this end, the patient community has developed 2 relevant draft patent laws and the following steps have been taken:

- specialized parliamentary committee members were provided with infographics depicting the negative influence of patent evergreening on drug prices.
- campaign to push members of the relevant parliamentary committee and MPs representing regions to support proposed changes
- - letter from the Ministry of Health in support of the proposed draft law.
- draft Law received positive feedback from WHO and UNDP.

Consequently, the specialized parliamentary committee voted to approve the draft law.

- Two training sessions on patent law were held for patient organizations.
- More than 20 expert appearances in media as well as a street action "Golden Drug" under the Parliament of Ukraine organized resulted in more than 50 publications.

Thanks to these efforts, two bills on patents and intellectual property received the preliminary support and are considered by the Parliament of Ukraine.
LESSONS LEARNED: The critical changes initiated by the community in patent and intellectual property law will benefit drug pricing expanding the number of patients treated by 40% as early as 2021.
Trainings on advocacy for patient organizations proved to be an important tool to bring legislative change.
CONCLUSIONS/NEXT STEPS: The pressure of the community-based organizations to expand access to treatment has yielded results in the form of two registered bills that will be adopted by the Parliament of Ukraine in the next six months.
The first to benefit from the adoption of these bills are PLHIV. In addition to those in treatment, another 60, 000 patients will be able to receive medication.
These bills will simplify the market for generic drugs for patients of other nosologies: with hepatitis C (82 thousand patients), patients with cancer (140 thousand patients annually)

PEF1748

BUILDING COMMUNITY CONSENSUS ON HIV/AIDS DISCRIMINATION IN NIGERIA TO ENCOURAGE STATE ACTION ON ANTI-STIGMA LAW

S. Aborisade[1]
[1]*AIDS Healthcare Foundation Nigeria, Abuja, Nigeria*

BACKGROUND: In Nigeria, stigma and discrimination are major obstacles to effective HIV/AIDS prevention, treatment, and care services. Nigeria's Anti-Discrimination Act of 2014 makes it illegal to discriminate based on HIV positive status. However, the lax judicial and legal environment renders the law ineffective. Notably, in states yet to put the law into practice, no legal compensation can be sought for rights infringements. It thus becomes important to rally community consensus for the law to work and serve the people.
DESCRIPTION: The Stigma Clinic is a roving platform of dialogue, story sharing, and partnership building that seeks to educate society on the Anti-Discrimination Act by leveraging key community influencers. It is led by patients and incorporates government, CBO, and CSO partners. Media is also used to highlight and moderate institutionalized HIV discrimination targeting PLHIV, while linking individuals seeking assistance for legal services. So far the Clinic has been held in two states and is moving soon to a third soon to continue creating a more supportive environment for PLHIV.
LESSONS LEARNED: The Clinic reveals stark disparity between what state officials in charge of the HIV response know and what the situation is on the ground. This directly impacts commitment. Governments showed willingness to act after gaining more knowledge and understanding of the situation, which suggests that constant strategic engagement and education is critical to achieving desired results from state actors. In Kogi, where the Clinic was first held, a commissioner became involved and began championing the process of enforcing the law. Changes also took place in some hospitals when PLHIV shared information in their testimonials. In Benue, a taskforce on stigma and discrimination was initiated immediately after the Clinic was held.
CONCLUSIONS/NEXT STEPS: Community ownership of initiatives on stigma is vital to creating a supportive environment that allows PLHIV to flourish. Safe spaces for PLHIV to share their stories unhindered within the treatment cascade is essential to inspire others. Direct, constructive dialogue with stakeholders, led by PLHIV, is a strategy that holds promise to normalize the environment and decrease stigma and discrimination.

PEF1749

IMPLEMENTATION OF THE STATE-OF-THE-ART LEGAL AID TOOLS FOR PEOPLE LIVING WITH HIV BY COMMUNITY-LED ORGANIZATION

M. Ignatushyna[1], A. Kapusta[1], K. Rivera[1], O. Kulchenko[1]
[1]*CO "100% LIFE" (All-Ukrainian Network of PLWH), Kyiv, Ukraine*

BACKGROUND: PLWH in Ukraine are systematically subject to violations of their rights.
15% experienced denial of access to treatment, 17% reported disclosure of HIV status by healthcare providers, 4% experienced discrimination in the workplace, and so on.
Therefore, in Ukraine there is an urgent need to put in place effective mechanisms for providing legal assistance and restoring violated PLWH rights.
DESCRIPTION: Since 2018, CO "100% LIFE" has been implementing a Legal Networking Project aimed at providing legal assistance to PLWH and vulnerable groups and restoring their abused rights.
The project is national in scope with coverage of all regions of Ukraine, with 12 local counseling offices..
Two approaches were applied to the implementation of the Project:
Restoration of violated rights of PLWH through legal support of court and pre-trial cases.
Creating an modern IT solution that enables PLWH and others to receive on-line and optionally, anonymous legal answers to the most common questions asked by people with HIV.
LESSONS LEARNED: During 2018-2019, 4680 PLWH and representatives of vulnerable groups applied for legal assistance concerning issues of violation of rights to access to medical care.
Over the course of the project:

- 47 court appeals were initiated and covered:
- disclosure of PLWH personal information.
- protecting the rights of a person growing cannabis for medical purposes;
- renewal of social security payments;
- administrative liability for driving while intoxicated due to false positive test results while taking ART, etc..

Ten cases have been referred to the European Court of Human Rights, one of which has been resolved in favor of the client, the other is still pending.

- "Legal Bot 100% LIFE" is developed and works across all major online platforms and messengers to inform and refer potential clients to human rights defenders and advocates for further support.

CONCLUSIONS/NEXT STEPS: 59% of court cases and 75% of pre-litigation were resolved in favor of clients.
Every month Legal Bot records at least 400 requests thus extending the on-line access of PLWH to legal information on the protection of their rights.
Through Project mplementation and Legal Bot functioning, PLWH and key communities have access to qualified legal assistance.

PEF1750

REDUCTION OF GENDER-BASED VIOLENCE (GBV) IN THE KÉDOUGOU GOLD REGION: WHAT COMMUNITY PARTICIPATION?

A. Konate[1], A.D. Ndione[2], A. Ngom[3], M. Ndiaye[4]
[1]*Conseil National de Lutte contre le Sida (CNLS), Kédougou, Senegal,* [2]*USAID - NEEMA, Kédougou, Senegal,* [3]*Centre Conseil Ado (CCA), Kédougou, Senegal,* [4]*Alliance Nationale des Communautés pour la Santé (ANCS), Kédougou, Senegal*

BACKGROUND: In Kédougou, GBV is frequent and is considered to be a factor of vulnerability of young people to HIV. The victims generally remain poorly known due to aspects linked to socio-cultural burdens. Those who come forward do not use formal justice and civil protection structures. The level of knowledge of the communities is low. To strengthen their participation in the fight against GBV and the sexual and reproductive health of young people, the CNLS, USAID / Neema and the CCA have joined their efforts to intervene in this direction.
GOALS: Describe the community mobilization strategy carried out in Kédougou to combat GBV with the involvement of the authorities.
DESCRIPTION:

- Coordination meetings with stakeholders

- Sharing of terms of reference for activities with administrative and medical authorities
- Empowerment of BajenuGox (community actors) and women's groups
- Involvement of players in education and sports and cultural associations from the desig of activities
- Meetings with neighborhood leaders

LESSONS LEARNED:

- Mass activities, training and local communication have seen35 men and 75 women sensitized to the Community Forum who took firm resolutions in response to GBV
- 724 students, including 307 boys and 417 girls participating in the awareness walk with reading and delivery of a memorandum to the Prefect of Kedougou
- 12 men, 204 women and 07 neighborhood leaders registered for social mobilization committed to combating GBV
- 266 boys and 351 girls participating in the community animation podium with a song competition on GBV
- 30 girls trained on GBV and committed to hosting talks
- 26 talks with 780 young beneficiaries
- 6 radio programs hosted by resource people with the participation of populations protesting against GBV
- Commitment of the Prefect to deliver the Memorandum to the competentauthority

CONCLUSIONS/NEXT STEPS: These activities have led to the commitment of authorities and community actors to reverse trends in GBV.

For the global response to HIV, it is essential that communities get involved. AIDS control programs such as the Youth Promotion Program, the Ministry of Youth, Reproductive Health of Adolescents and Young People of the DSME / MSAS should also include the fight against GBV in their prior

LAWS, POLICIES AND PRACTICES IMPACTING ACCESS TO HIV TESTING, PREVENTION, TREATMENT, CARE AND SUPPORT

PEF1751

ENABLING ACCESS TO CARE: COVERAGE OF HIV TESTING AND TREATMENT IS HIGHER IN COUNTRIES WITH SUPPORTIVE POLICY ENVIRONMENTS

A. Bush[1], V. Vasireddy[1], M. Ruffner[1], J. Palen[1], M. Wollmers[1], A. Nandakumar[1]
[1]*U.S. Department of State, Office of the U.S. Global AIDS Coordinator, Washington, United States*

BACKGROUND: While effective HIV testing and treatment services are increasingly available around the world, the ability for individuals to access these services is often dependent upon the implementation of a myriad of evidence-based national policies. Given the importance of an enabling policy environment, we would expect to see that countries that have lagged behind in implementing key policies will generally achieve lower coverage levels for HIV testing and treatment.

METHODS: The Sustainability Index and Dashboard (SID) is a tool developed by PEPFAR and UNAIDS to assess the sustainability of a country's HIV response. The Policies and Governance element of the SID measures the degree to which a national government has adopted a range of key policies and laws, including those that maintain best practices for treatment and prevention guidelines, protect key populations, and mitigate structural barriers. In this analysis, we investigate whether national-level implementation of a package of key HIV policies is associated with HIV testing and treatment coverage (as measured by UNAIDS data).

RESULTS: Scoring on the Policies and Governance element of the SID is positively associated with HIV testing and treatment coverage among 23 PEPFAR bilateral recipient countries. Scoring one point higher in the SID's 10-point Policies and Governance element was associated with an increase of 7.104 percentage points in percentage of PLHIV who know their status and an increase of 5.718 percentage points in percentage of PLHIV on ART in 2018.

	(1) Percent of PLHIV who know their status (2018)	(2) Percent of PLHIV receiving ART (2018)
Policies and Governance Score (0 to 10) SID 2017	7.104*** (2.075)	5.718** (2.676)
R^2	0.588	0.346
Number of Countries	21	23

Notes: Models represent OLS regression estimates. % of PLHIV who know their status and % of PLHIV receiving ART both come from UNAIDS 2018 estimates. Controls include income group (World Bank 2018), HIV prevalence (UNAIDS 2018), and total number of PLHIV (UNAIDS 2018). 99% (***), 95% (**), and 90% (*) confidence.

[Table 1. Association between policies and governance SID score and HIV testing and treatment levels]

CONCLUSIONS: Continued progress in implementing key policies is likely to be an important factor for closing testing and treatment gaps in the short-term and for establishing sustainable control of HIV in the long term. The SID can be a helpful tool to foster dialogue among governments and key partners to identify and address policy barriers that may be preventing further improvements in testing and treatment coverage.

PEF1752

TREADING LIGHTLY: NAVIGATING THE SHADOWLANDS BETWEEN POLICY AND LAW FOR SEXUAL AND GENDER MINORITIES IN EAST AND SOUTHERN AFRICA

R. Walters[1], L. Mondry[1]
[1]*Positive Vibes Trust, Cape Town, South Africa*

BACKGROUND: *"Bridging The Chasm"*, a SRH-R project implemented by Positive Vibes, through Amplify Change, partners with LGBTIQ and sex-work organisations in five Southern/East African countries to increase quality access to effective, appropriate sexual and reproductive health services for sexual and gender minorities; promote rights-forward approaches to health; and utilise local evidence to influence practice and improve policy engagement. Monitoring, accountability, public participation, active citizenship, democratisation of public health and good governance constitute underlying concepts and activities.

DESCRIPTION: In 2019, LGBTIQ and sex work organisations applied *"Setting The Levels (STL)"* amongst their constituencies in Lusaka, Harare, Francistown, Walvis Bay, Gulu and Mbarara. This participatory methodology for systematic community-led monitoring of health facilities supported diverse populations, communities and healthcare workers from 18 local facilities to review, reflect and dialogue around their distinct perspectives, perceptions and experiences of healthcare, and plan for measurable, accountable improvement.

LESSONS LEARNED: Proximity to communities and organised civil society in five countries allows for illuminating context analysis. It highlights the glaring gap between policy, law and lived experience of minority citizens, the illogical inconsistencies of which frame a *shadowland* where marginalisation, exclusion and structural injustice bloom. Where Ministries of Health pass progressive policy – eg. multi-million dollar "pro-KP" National AIDS Plans – dramatically at odds with punitive policies of Ministries of Justice, within the same government. Where a limited band of SRH services for "KPs" are outsourced to NGOs to avoid responsibility and integration by primary health facilities in the public sector. Where, despite domestic Constitutional obligations and international treaty commitments, laws are misapplied, conveniently, to fuel prejudice, to gain electoral popularity, to institutionalise violence through State apparatus, to deny services to populations whose identities have been leveraged by the same State to attract aid.

CONCLUSIONS/NEXT STEPS: The effects are not benign. At best, they confirm a troubling lack of integration at structural level, where duty-bearers offer a duplicitous acknowledgment of minorities to the international community and an intractable domestic denial. At worst, the law is used with impunity – a blind eye, a cold shoulder, despite policy or promise – to harass, persecute and isolate those most vulnerable, to the detriment of HIV outcomes.

PEF1753

NATIONAL EX-PRISONERS ASSOCIATIONS IN SOUTHERN AFRICA BREAKING BARRIERS AND CREATING ALLIANCES FOR REGIONAL ADVOCACY TO IMPROVE ACCESS TO HIV/AIDS, PSYCHO-SOCIAL RESILIENCE AND MENTAL HEALTH SERVICES

T. Ponde[1], C. Ingleby[2], T. Sekeso[1]
[1]*VSO, International Programmes, Harare, Zimbabwe,* [2]*VSO, Programme Development, London, United Kingdom*

BACKGROUND: Ex-prisoners living with HIV experience weak health referral, poor case management, loss to follow up, stigma and discrimination from families, communities and health care providers, leading to poor treatment adherence and continuation of high risk behaviors. Formation of National Ex-prisoner associations in Eswatini, Malawi, Zambia and Zimbabwe created national and regional advocacy platforms for more accessible health services, including psychosocial support and mental health, leading to reduced recidivism and improved institutional support.

DESCRIPTION: The Regional Project set up National Ex-prisoner Associations in four countries, led by ex-prisoners including women and youths, with participation from families, community representatives, civil society organisations, Prisons and Correctional Services The platforms promote psycho-social resilience for ex-prisoners and advocate for operationalization of the SADC Minimum Prison Health Standards for HIV and AIDS, STIs, TB, and other non-communicable diseases. These National Associations came together to form a Regional platform to advocate for ex-prisoners rights.

LESSONS LEARNED:

- National Associations create safe spaces for ex-prisoners living with HIV, contribute to their psycho-social resilience and provide a platform to build more trusting relationships with families and communities.
- The platforms break barriers around accessing treatment, contribute to reduced stigma and discrimination and promote health seeking behaviors including accessing SRH services.
- They have amplified the voice of a key population, supporting ex-prisoners to advocate for their health rights whilst also building their own confidence and resilience.
- Forming a Regional Platform has resulted in a regional advocacy approach being adopted in support of the implementation of the SADC minimum standards for treatment, care and support of prisoners with HIV, STIs, TB and those needing psycho- social support.
- A stronger health referral approach to ensure linkages between prisons and communities is needed to ensure better case management for ex-prisoners living with HIV.
- National Ex-prisoner Associations contribute significantly to ensuring that a key population is not left behind in the fight to end AIDS by 2030.

CONCLUSIONS/NEXT STEPS: Thanks to the initiative of the ex-prisoners, connections made and alliances and networks created, the regional project received funding from Robert Carr Foundation to strengthen national platforms, register them and engage with SADC to provide strategic support in influencing member states.

PEF1754

USING THE LEGAL GAPS IN THE LEGAL SYSTEM TO PROVIDE HIV AND TB SERVICES TO SEXUAL MINORITIES, PLHIV AND THOSE WITH TB: A CASE OF THREE DISTRICTS IN UGANDA

C. Baguma[1], J. Nakyeyune[1]
[1]*Center For Health, Human Rights and Development (CEHURD), Knowledge Management, Kampala, Uganda*

BACKGROUND: Uganda is one the countries where national laws criminalize and penalize behaviors of some key populations and are used arbitrarily to arrest and detain them and their health care providers. The current laws against homosexuality, drug abuse and prostitution, and the way they are enforced has fueled widespread human rights violations against sex workers, sexual minorities, PLHIV and people who use drugs, compounding the multiple vulnerabilities to HIV that these and other Vulnerable populations already experience.

DESCRIPTION: CEHURD undertook a study to map and identify the current existing laws and regulations that may affect the rights of vulnerable populations to HIV and TB health services in Uganda and determine how these current laws and regulations affect provision of HIV and TB services to Vulnerable populations and PLHIV at national, district and service delivery levels and also use the same laws and policies to benefit these populations.

LESSONS LEARNED: It was found out that the Ministry of Health is implementing, differentiated HIV and TB services tailored to the risks and vulnerabilities of KP and PLHIV that has legal gaps arising from rushed legislation to curtail the increasing number of sexual minorities in Uganda. There are sections within the laws for example like the anti Narcotic act that prohibits the use of drugs but has a clause where government is mandated to create rehabilitation centers for drug users. The HIV prevention Act mandates the government to create the AIDS Trust Fund among others.

CONCLUSIONS/NEXT STEPS: CEHURD used Strategic Litigation and policy analysis to help the Ministry of health and policy makers to review these contradicting laws and to make adjustments to address these contradictions; enact the laws to address the risks and vulnerabilities for the specific KPs and PLHIV; and simplify the laws and policies so that they can be easily understood at all levels of services

delivery. MoH have used the policies and guidelines to guide parliament on the legislation of the rights of KP and PLHIV to HIV and TB services. A policy brief has been developed out of this study to guide government and Ministry of Health in implementing the recommendations.

PEF1755

CRIMINALIZATION OF SEXUAL AND GENDER MINORITIES IN ZAMBIA: IMPLICATIONS FOR THE HIV TREATMENT CASCADE

V. Yelverton[1], S. Qiao[2], G. Harper[3], A. Manon[4], L. Ngosa[5], M. Kabwe[6], S. Harrison[2], S. Weissman[7], X. Li[2]
[1]Department of Health Services Policy and Management, South Carolina SmartState Center for Healthcare Quality (CHQ), University of South Carolina Arnold School of Public Health, Columbia, United States, [2]Department of Health Promotion, Education, and Behavior, South Carolina SmartState Center for Healthcare Quality (CHQ), University of South Carolina Arnold School of Public Health, Columbia, United States, [3]Department of Health Behavior & Health Education, University of Michigan School of Public Health, Ann Arbor, United States, [4]Department of Psychology, University of Zambia, Lusaka, Zambia, [5]Board Member, Friends of Rainka Zambia, Lusaka, Zambia, [6]Key Populations Advisor, National AIDS Council Zambia, Lusaka, Zambia, [7]Department of Medicine, University of South Carolina School of Medicine, Columbia, United States

BACKGROUND: While sexual and gender minorities (SGM) carry a particularly high burden and risk of human immunodeficiency virus (HIV) infection, the criminalization of same-sex sexual behaviors impedes HIV prevention and care for SGM. To effectively respond to the HIV epidemic in Zambia, a comprehensive understanding of the impact of anti-SGM legislation is needed. This study reviews Zambian legislation impacting SGM and outlines potential consequences at the individual and societal level, and for the HIV treatment cascade.

METHODS: A critical literature review in HeinOnline, Index to Legal Periodicals & Books, PubMed, and Medline was conducted in June and July 2019. Search terms were organized by three categories: LGBTQ, law and policy, and Zambia/Sub-Saharan Africa. Grey literature and Zambian law codes were searched online. Literature was analyzed and synthesized using thematic synthesis and meta-synthesis methodology.

RESULTS: The critical review identified three Zambian statutes prohibiting gender-based discrimination and promote gender equality. Same-sex attraction is not illegal in Zambia. However, three laws were found that affect SGM by criminalizing/restricting same-sex sexual behavior, marriage, and adoption. Thirty-six identified literature sources highlight the negative effects of such legislation at the individual and societal level, and for the HIV treatment cascade. At the individual level, such laws may limit legal protection and representation for SGM, increase their vulnerability for violent and other criminal acts, and expose them to stigma and discrimination. At the societal level, anti-SGM laws pose significant threats to human rights. Effects on the HIV treatment cascade include underrepresentation of SGM in HIV policy, programming, and research; lower access to and utilization of HIV prevention, testing, and care due to fear and stigma; and suboptimal quality of care by healthcare providers.

CONCLUSIONS: This review illustrates the extent and impact of laws criminalizing same-sex sexual behavior in Zambia. Short-term policy recommendations derived from this review include prioritizing protections for vulnerable individuals, including SGM. In addition, increasing the capacity for SGM-friendly healthcare services, including HIV testing and care, is a priority. Long-term recommendations include the decriminalization of same-sex sexual behaviors, explicit protection of the human rights of SGM, and broad public efforts to reduce stigma towards SGM.

PEF1756

CASE-LAW OF THE INTER-AMERICAN COURT OF HUMAN RIGHTS, CASE CUSCUL PIVARL AND OTHERS VS. GUATEMALA: CASE 12484

M. Calderón[1]
[1]San Carlos de Guatemala, Guatemala, Guatemala

BACKGROUND: In Guatemala the access to Comprehensive HIV Care and Treatment is exclusively for two hospitals out of 44, which means that people have no access to Comprehensive HIV Care, resulting in premature deaths, mother-to-child infection etc.
In the year 2000, a lawsuit was filed against the State of Guatemala for lack of access to Comprehensive HIV Care, along with 39 people with HIV, demanding to protect their lives throughout the territory of Guatemala.

DESCRIPTION: In 2000 an unprecedented process began in Guatemala and the latin region for the lack of Comprehensive HIV Care, a lawsuit started at internal level to ensure a Comprehensive HIV Care, then it was raised to the Inter-American Commission on Human Rights, which in 2005 became Case 12484, requesting a substantive report from the State of Guatemala and from the victims; the process of research and gather the information requested by the Inter-American Commission was a titanic deed but after a long process of 13 years finally it was elevated to the Inter-American Court of Human Rights, where we held a hearing with two of the victims and their representatives to deliberate the liability of the State.
http://www.corteidh.or.cr/docs/casos/articulos/seriec_359_esp.pdf

LESSONS LEARNED: Perseverance and union for 18 years managed to obtain a sentence in favor of humanity.

CONCLUSIONS/NEXT STEPS: There must be constant monitoring of the sentence in order to the sentence be fully complied in Guatemala. The jurisprudence derived from the judgment means that if in other countries parties of the OAS, can cite Case 12484 and automatically win the Case.

PEF1757

CHANGING DRUG LAW AS VECTOR FOR DRUG USERS ACCESS TO HEALTH SERVICES IN MYANMAR

L thu[1]
[1]*Asian Harm Reduction Network, Program, Yangon, Myanmar*

BACKGROUND: Early 2018 the amended Narcotic Drugs and Psychotropic Substances Law (NDPS) was passed by Parliament ("Pyidaungsu Hluttaw"), the law showed improvements, albeit not in sync with the applauded public health oriented national drug policy. Critical issue is the exclusion of the "exemption" clause for personal use and possession (section 16 C); resulting possession of any quantity of substances is "punishable with imprisonment which may extend from a minimum of 5 years to a maximum of 10 years".

DESCRIPTION: This study examines the awareness of the drug use & community 'acceptance of exemption for possession of a certain amount of substances in order to prevent barriers for drug users to access health services.

LESSONS LEARNED: The qualitative study collected data Bamaw Township through in-depth interviews with 30 drug users and 4 focus-group discussions with 24 community members.

Of the interviewed random selected drug users, 43% of had a history of incarceration for possession of drugs for personal use, of which 71% did not receive continuation of treatment including HIV and MMT as during incarceration, there was no access to treatment options. Among the drug using participants, 90% of drug users underwent detox or rehab at least once, with 90% relapse rate, 53% did not find current drug law assist in accessing treatment and 57% felt a need for exemption of possession of predefined amounts. When the community members were asked for option for drug users, all community suggested drug users need support and/or treatment to mitigate burden on communities. 75% favored psycho-social support, all respondents support MMT, 12.5% of the participants see NSP as solution. 58% of community members would accept exemption of possession.

CONCLUSIONS/NEXT STEPS: The existing legislative, cultural and political circumstances in Myanmar makes an enabling environment and providing support and care to PWID/PWUD very challenging. Evidence suggest that there is mixed objections/resistance from community on exemption for possession for personal use would aggravate barriers for drug users to access health services. More community based advocacy and awareness raising is in critically needed.

PEF1758

PROMOTING MIGRANT HEALTH THROUGH SUCCESSFUL ADVOCACY TO STOP SHARING OF MIGRANTS' PERSONAL DATA BY THE UK NATIONAL HEALTH SERVICE WITH IMMIGRATION AUTHORITIES

D. Gold[1], K. Smithson[1], T. Manuel[1]
[1]*NAT (National AIDS Trust), London, United Kingdom*

BACKGROUND: NHS Digital (holding data for the UK's National Health Service) had been sharing personal data on patients with immigration authorities for immigration enforcement purposes in the UK. Migrant populations are disproportionately affected by HIV in the UK. There was consensus and evidence that data sharing acts as an obstacle to accessing healthcare in the UK. Data sharing deters migrants from accessing HIV prevention, testing and treatment and presents a risk to individual and public health.

DESCRIPTION: NAT brought together a coalition of HIV sector, migrant groups and medical professionals to campaign against data sharing. NHS Digital agreed to review the practice, however, the data sharing practice was instead formalised by a Memorandum of Understanding (MoU) without consultation. NAT escalated the matter to the UK Parliament's Health Committee who agreed to undertake an inquiry. The coalition gathered evidence for the inquiry and demonstrated public disagreement with the MoU through petition. The Committee's report recommended the immediate end of the MoU. Following these interventions, the Government agreed to suspend the MoU and restricting instances where data can be shared. In November 2018 the MoU was withdrawn. NHS Digital has assured coalition partners that we will be consulted on the development of any new MoU. NAT also worked with the National Data Guardian and MPs to secure legal change to give the National Data Guardian more powers in the future to influence such decisions.

LESSONS LEARNED: This was achieved even in a political environment which is increasingly hostile to migrants. By combining pubic campaigning with evidence, the coalition gained respect and trust from NHS Digital and the National Data Guardian. Advocacy groups were able to influence greater change by not only ending the MoU but enhancing future accountability through the National Data Guardian.

CONCLUSIONS/NEXT STEPS: The coalition continues to build on these relationships to advocate for the right of migrants to access healthcare without fear of immigration enforcement. NAT is also working to ensure that migrants are considered a key population in the UK's response to HIV and work with coalition members to prevent further data sharing is critical to this.

PEF1759

A COMPREHENSIVE REVIEW OF HIV MEDICAL GUIDELINES IN STATE AND FEDERAL PRISONS IN THE UNITED STATES

K. Kuenzle[1], J. Sherwood[1], B. Honermann[1], A. Jones[1], G. Millett[1]
[1]*amfAR, The Foundation for AIDS Research, Public Policy Office, Washington D.C., United States*

BACKGROUND: HIV prevalence among people living in U.S. federal and state prisons is three to five times higher than the national prevalence. The CDC recommends that all correctional medical clinics offer opt-out HIV screening, provide HIV education to all inmates during intake and incarceration, and provide medication and link-

age to medical services to the inmate upon release. However, these guidelines are not uniformly incorporated. We review all Bureau of Prison (BOP) and department of corrections' (DOC) medical guidelines to examine state-level variation in prison HIV policies.

METHODS: Medical guidelines from the BOP and DOC for each state and Washington, D.C., which were searchable through publicly available online sources or obtained through email correspondence with DOC staff (n=42) were reviewed for evidence of HIV polices. For HIV testing, data from a BOP review of HIV testing practices in state prisons was used for all states and Washington D.C. (n=51). Guidelines were reviewed for policies related to: 1) HIV testing, 2) education, 3) linkage to care after release, and 4) post-discharge ARV supply services – as recommended by the CDC. For each category, states were coded as "yes" if there was any evidence of the HIV service in the medical guidelines.

RESULTS: The BOP guidelines mandate the provision of all four CDC recommended HIV services for federal prisons. For state prisons, all states offer HIV testing, but only 33.3% (17/51) provide best-practice opt-out testing, as opposed to mandatory or opt-in testing. 71.4% (30/42) of DOC mandate the provision of HIV education, 26.2% (11/42) mandate the provision of ARVs, and mandate linkage to community services upon discharge. Five DOC (Louisiana, Maryland, Pennsylvania, Tennessee, Washington D.C.) mandate the provision of all four of the CDC recommended HIV services, while eight DOC (Florida, Hawaii, New York, N. Dakota, Oregon, Rhode Island, S. Dakota, Utah) do not include any of the recommended services.

CONCLUSIONS: The majority of state DOC do not have HIV polices that align with CDC guidelines. This is a missed opportunity that must be corrected in order to meet the HIV and health needs of this high risk population during and after incarceration.

PEF1760

STIGMATIZED AND CRIMINALIZED: NAVIGATING PATHWAYS TO PREP FOR IMMIGRANT LATINX MEN WHO HAVE SEX WITH MEN (MSM) IN CALIFORNIA

A. Miyashita Ochoa[1], J. Barreras[1], R. Estrada[2], I. Holloway[1,1]
[1]University of California, Social Welfare, Los Angeles, United States, [2]Bienestar, Los Angeles, United States

BACKGROUND: Although Latinx individuals are more likely to be interested in pre-exposure prophylaxis (PrEP), they have the lowest overall rates of PrEP uptake in California. Further, disparities with regard to immigrant populations may reflect the current political climate, including anti-immigrant sentiment enshrined in federal law and policy.

In California, however, numerous actors collaborate to expand access to PrEP throughout the state by enrolling people, regardless of immigration status, into the State's PrEP Assistance Program (PrEP-AP) which covers eligible participants' PrEP-related costs. This study sought to identify barriers and facilitators to increasing PrEP uptake among immigrant Latinx MSM (ILMSM).

METHODS: Using community-based participatory research (CBPR), we recruited HIV service providers currently working within PrEP-AP programs (N=11) with experience serving ILMSM, including ILMSM without documented immigrant status. Through semi-structured, qualitative interviews conducted via an online video conferencing platform, we sought to understand providers' current strategies for increasing awareness and uptake of PrEP among ILMSM clients and barriers and facilitators to doing so. Interviews were recorded, transcribed verbatim and analyzed using a rapid assessment process for health policy research. Prominent themes were identified and organized in a matrix to highlight key domains of inquiry across participants.

RESULTS: Core themes included: (1) how culture intersects with various forms of stigma to reduce PrEP knowledge; (2) how documentation status influences access to information about PrEP; and (3) how perceptions about eligibility for PrEP services influence the accessing of PrEP resources. While these themes elucidated the many barriers to increasing PrEP use by ILMSM, data also pointed to potential facilitators. These included factors related to PrEP-AP staffing, flexibility in service provision, additional health and social supports needed and cultural humility and basic competency to address complicated queries related to immigration and use of publicly-funded services.

CONCLUSIONS: PrEP-AP is an innovative attempt to expand PrEP services to ILMSM in California. Our findings suggest allocating more flexible funding to local communities to conduct direct outreach to ILMSM, ongoing training to develop culturally informed staff and structural changes in service delivery protocols to address uncertainties ILMSM face, which may be related to the current political climate.

PEF1761

MY HEALTH MY RIGHTS: IMPROVE HEALTH AND HUMAN RIGHTS PRACTICES AND ACCESS TO JUSTICE FOR COMMUNITIES AFFECTED BY HIV/AIDS IN MEXICO

C. Cruz-Camacho[1], J.J. Hernández-Chávez[1], J. Elizalde-Peña[2], R. Suarez[3], O. Vásquez Chávez[4]
[1]Colectivo Sol AC, Ciudad de Mexico, Mexico, [2]Colectivo Ser Gay de Aguascalientes AC, Aguascalientes, Mexico, [3]Centro de Apoyo a las Identidades Trans A.C., Ciudad de Mexico, Mexico, [4]No Dejarse es Incluirse, Vida Plena AC, Puebla, Mexico

BACKGROUND: My health, my rights (MHMR) is an institutional program managed by Colectivo Sol in partnership with five CSOs working on HR. The program was launched in 2008 with the purpose of reinforcing the sense of citizenship of LGBTTTI populations in Mexico through community systems strengthening, evidence-based advocacy actions and external relations. The program focuses on transgender women with emphasis on transgender women who are also sex workers, and effeminate gay men, two sub-population segments whose rights suffer most abuses, violence, human right violations and assassinations in Mexico.

DESCRIPTION: MHMR transfers practical tools and community-based peer outreach strategies to enable partner organizations to record data on human rights violations experienced by individuals from key populations (KP); provides information and referrals of abuse victims to health, legal and other public services; and uses collected and systematized data to inform state-based human rights-based HIV programming, policy and advocacy at municipal, state and national level. MHMR follows the REAct methodology (Rights - Evidence – ACTion), Developed by AIDS Frontline.

LESSONS LEARNED: Access of MHMR partners to dynamic and practical tools provided by the program, have opened new opportunities to address KPs' needs and to develop new capabilities on health, rights and security-related activities undertaken by KPs and public servants at local level.

Wide acceptance of KP in terms of training methodologies on human rights, health and security has been an excellent way to consolidate a grassroots approach and to facilitate integrated collaboration with program partners.

CONCLUSIONS/NEXT STEPS: To share with strategic stakeholders addressing human rights violations of KPs the results of the MHMR model developed by the program, including activists, public servants, sexual diversity secretariats of three political parties and municipal authorities.
To design, organize and promote a public campaign on decriminalization of HIV from penal codes in program localities.
To publish and disseminate case studies addressing the value of MHMR community-based approach

LAWS AND POLICIES REGULATING ACCESS TO DRUGS AND MEDICAL DEVICES (INCLUDING INTELLECTUAL PROPERTY AND TRADE REGIMES, COMPETITION LAW AND PRICE REGULATION)

PEF1762

3-STEP RESEARCH ON PATENT MONOPOLIES IMPACT ON ACCESS TO ESSENTIAL TREATMENT FOR HIV PATIENTS

M. Trofymenko[1]
[1]*100 Percent Life, Kyiv, Ukraine*

BACKGROUND: Intellectual property is a well-known factor impacting access to the essential HIV treatment worldwide, nevertheless, there is a lack of measurement data proving the restrictive impact of the unfair patenting practices on access to medicines. The 100 Percent Life has launched 3-step research aimed at determining sums annually overpaid due to the unfair patent monopolies within the medicines procurements.
METHODS: The starting point of the research is an analysis of the state procurements and determining the percentage of INNs procured from a single source in Ukraine. Researching patent status for those INNs allowed to assess the number of medicines monopolized due to the patents. The next step is an analysis of patent-protected medicines according to the UNDP guidelines for pharmaceutical patent examination and evaluation of the number of INNs monopolized by evergreening patents. Comparing the originator`s prices for those medicines in Ukraine and the generic prices in similar countries according to GDP per capita allowed assessing actual overpay caused by unfair monopolies. A similar methodology could be used for understanding the losses caused by supplementary protection certificates, data exclusivity and absence of Bolar exemption.
RESULTS: Evaluation of state medicines procurement determined that about 50% percent of medicines were bought from a single source without any generic competition. Patent search for single-source INNs demonstrates that more than 90% of single-source INNs are monopolized by the patents. The price comparison of medicines procured from the originator in Ukraine and monopolized by the evergreening patents and prices for the generic versions of the same medicines in similar countries according to GDP per capita allows estimating approximate annual overpay in the amount of 20 million USD (about 15% of all yearly budget for medicines procurement in Ukraine). Determining the costs of data exclusivity and other TRIPS-plus provisions in Ukraine is ongoing and to be finalized in the middle of 2020.
CONCLUSIONS: The methodology used in the research proved to be an effective tool for determining the losses of the country due to excessive patent protection. The detailed, evidence-based figures of the damages caused could be further effectively used for the advocacy of TRIPS-flexibilities implementation.

PEF1763

OPPOSITIONS AGAINST ABUSIVE PATENTS ON MEDICINES BY CIVIL SOCIETY: AN EFFECTIVE WAY TO BREAK MARKET MONOPOLIES AND REDUCE TREATMENT COSTS

S. Kondratyuk[1], O. Mellouk[2], M. Ahmar[2], D. Peeler[2], W. Jallow[3]
[1]*ITPC Global, Kyiv, Ukraine,* [2]*ITPC Global, Marrakech, Morocco,* [3]*ITPC Global, Gaborone, Botswana*

BACKGROUND: Price is a key determinant of access to medicines. It is directly linked to the degree of protection of the medicine by patents, which guarantees the patent holder a market monopoly for a period of 20 years prohibiting the use of much more affordable generic versions. In 2015, ITPC launched the Make Medicines Affordable campaign in collaboration with a consortium of associations from middle-income countries (Argentina, Brazil, Thailand and Ukraine). The campaign aims to facilitate the entry into the market of generic versions of antiretrovirals by opposing the abusive patents aimed to prohibit or delay the market entry of generics.
DESCRIPTION: To carry out its actions, the consortium work is based on the legal provisions included in national intellectual property laws and international agreements (the TRIPS Agreement) which allow third parties, including civil society organizations, to oppose the issuance of patents that do not meet criteria set by law. Between 2015 and 2019, 18 oppositions were filed with the patent offices in our countries of intervention.
LESSONS LEARNED: 5 oppositions resulted in the rejection of the patent, 1 patent has been abandoned by the owner and 12 are currently under examination. Contrary to our expectations, patent offices appreciated the contribution of civil society as a means of improving the quality of examination of patents by allowing third parties to provide information that would not be available to offices. An independent external evaluation (relating to 14 oppositions) commissioned in 2018 by UNITAID the donor of the project estimated the actual savings at between US $ 238 and 345 million.
CONCLUSIONS/NEXT STEPS: Opposing abusive patents is an effective way to break monopolies in the drug market by making it easier to bring more affordable generic versions to the market and saving money for national HIV programs. Civil society, when well trained and equipped, can carry out this type of activity. Given the success of the activities, at the end of 2018, UNITAID agreed to extend the project until 2021 with an extension from 4 to 17 middle-income countries and by extending the field of action from HIV to HCV and tuberculosis.

PEF1764

PROMOTION OF ACCESS TO MEDICINES: IS COMPULSORY LICENSING OR VOLUNTARY LICENCING THE ANSWER?

C. Kittitrakul[1]
[1]*AIDS Access Foundation, Sapansoong, Thailand*

BACKGROUND: It has been globally questionable if voluntary licensing is a good tool for the promotion of sustainable access to affordable medicines. The territory restriction in the voluntary licenses is problematic. Developing countires in need of affordable medicines are left out. Criteria of the inclusion in the licenses are unclear and subjective. After compulsory licensing issued by several developing countries, inlcuding Thailand, voluntary licensing has been used more widely by the giant pharmaceutical industry to promote their better image and to undermine the use of compulsory licensing.

Thailand had never used any voluntary license until the late 2018, its first voluntary license for sofosbuvir and sofosbuvir/ledipasivr.

This paper aims to demonstrate influence of compulsory license by Malaysia consequently resulting in the extended license for sofosbuvir to Thailand, Malaysia, Ukriane, and Belarus.countries, including Thailand.

DESCRIPTION: The information of the paper is based on experience the civil society's movement and actions in Thailand demanding hepatitis C treatment with newer HCV DAAs at no cost under the country's universal health coverage scheme since 2013 – 2019.

Consequently, from April 2018 – June 2019, almost 30,000 people living with chronic hepatitis C, included HIV+ peple with HCV co-infection in Thailand were treated with sofosbuvir & sofosbuvir/ledipasvir.

LESSONS LEARNED: The success requires united movement of civil society groups in different countries who share the same faith in the lack of access to affordable HCV DAAs and advocacy and actions across the regions and in the countries to create pressure to the governments and the giant pharmaceutical industry.

CONCLUSIONS/NEXT STEPS: Issuance of a compulsory license by a country will have great impact not only in that country but also but other developing countries. For instance, Thailand's compulsory license in 2007 influenced the original-drug companies to cut down their ARVs' prices worldwide announced to reduce their ARVs' prices. The compulsory licensing by Malaysia forced Gilead to extend its voluntary license to cover more developing countries allowing those countries to import generic sofosbuvir at affordable prices into the countries.

Compulsory license is an influent tool for lowering prices and scaling up access, and also influencing the extension of voluntary licenses to cover more countries.

PEF1765

COUNTERING HIV AND HEPATITIS EXCESSIVE DRUG PRICES IN EUROPE BY ADOPTING INTELLECTUAL PROPERTY STRATEGIES FROM ACTIVISTS IN LOW- AND MIDDLE-INCOME COUNTRIES

C. Izambert[1], I. Alaoui[1], A. Toullier[1]
[1]*AIDES, Pantin, France*

BACKGROUND: Since the 2010s, high-income countries began to face difficulties in accessing innovative drugs due to excessive prices. It became clear in 2014 when Sofosbuvir, the new hepatitis C medicine, was commercialized in Europe for 40k€ the 3-month-cure. However, in low- and middle-income countries (LMIC), activists had already developed various intellectual property strategies to counter patent system abuses and exorbitant prices, including patent opposition, unilaterally fixed price and compulsory licensing.

DESCRIPTION: Based on the experience of activists in LMIC, European civil-society organizations started to take into account price-setting concerns, linking them to access issues for the first time. This transition was illustrated clearly in two cases:

In March 2017, a coalition of organizations including AIDES filed an opposition to contest one of the patents covering Sofosbuvir by claiming it was not an innovation per se. In September 2018, the European Patent Office ruled in favor of maintaining the patent, although it amended its scope. The civil-society coalition has decided to appeal this decision in order to maintain pressure against unfair pricing and patenting.

Civil-society coalitions also combated the extension of Truvada's monopoly. While the patent on this HIV drug was due to expire by July 2017, the pharmaceutical company Gilead obtained a supplementary protection certificate (SPC) maintaining its monopoly until February 2020. SPC provides for a compensatory extension when the period between the patent's filing date and the marketing authorization exceeds 5 years. A thorough analysis from European treatment activists and a referral to the European Union Court of Justice were necessary to demonstrate the extension was invalid.

LESSONS LEARNED: Both procedures contributed to lower prices in 2017: cures went from 41 to 28,7k€ for Sofosbuvir and from 400 to 160€ for Truvada. Price-cutting was especially critical to roll-out Truvada's use for PrEP in France.

CONCLUSIONS/NEXT STEPS: This transfer of experience from precursor activists in LMIC to activists in Europe illustrates that challenging drug prices has become a global issue, and that civil-society organizations must expand their expertise to counterbalance the hegemony of pharmaceutical companies. Our efforts with the Sofosbuvir appeal must now continue, as we consider its price is still excessive.

PEF1766

PUBLIC PURCHASES AND HIV IN GUATEMALA, 2018

A. de León[1]
[1]*International Treatment Preparedness Coalition Latin American and Caribbean ITPC-LATCA, Regional Director, Guatemala, Guatemala*

BACKGROUND: Guatemala is the country most affected from Central America in terms of the rate and prevalence of HIV, HCV and TB. The treatment coverage is only 47% for HIV and even less for HCV and TB. High prices of drugs in Guatemala, caused by legal barriers such as intellectual/industrial property, issues related to lack administrative management and use of purchasing modalities that do not guarantee efficient use of resources, what makes a weak procurement system, at the same time, low level of community´s education and skills in access to treatment advocacy issues have made impossible an effective dialogue with the Authorities of National Health System along the years.

METHODS: The analysis performed for the construction of this document was quantitative, and retrospective. For this purpose, the "Official Projection of the need for medicines Guatemala 2017" was used, carried out in 2016. as the basis of medicines to which would be followed up on the issue of publicly funded acquisitions in 2017 and 2018. The research was on patent status and data protection of antiretroviral drugs in Guatemala was carried out, identifying Patent number, expiration date and source.

RESULTS: With the acquisition price data compared against the reference price data was established efficient and inefficient purchases, also was determined how many bottles were acquired against how many could have been acquired, and building a scenario on how this would impact coverage, through a unique Spanish speaking platform, interactive and dynamic that display on a screen the most relevant information of each acquisition, or the set of purchases analyzed, or segmenting data by purchasing unit or protection with legal barrier.

The ITPC LATCA support on the regional level influences to increases advocacy activities lookingo for make medicines affordable in countries.

CONCLUSIONS: The analysis of public purchases of medicines provides an effective panorama for decision-making and creation of strategies that can be used by civil society organizations to demand

rights that guarantee universal treatment coverage, and predictive data analysis to build projections, in addition; transformation of data into useful and timely information to support the decision-making process and the prioritization of strategic and institutional objectives.

PEF1767

PATENT OPPOSITIONS ACADEMY. A PROMISING COMMUNITY-DRIVEN LEARNING INITIATIVE TO PREVENT LOW QUALITY PATENTS ON MEDICINES AND PROMOTE ACCESS TO TREATMENT

S. Kondratyuk[1], O. Mellouk[2]
[1]*ITPC Global, Kyiv, Ukraine,* [2]*ITPC Global, Marrakech, Morocco*

BACKGROUND: Affordability of HIV medicines is closely related to presence of competition on the market.

Back in 2001 generic competition led to lowering of price of HIV treatment from $10439 to $295 ppy, which enabled scale up of treatment coverage in the last 19 years from 0,6 mln to 24,5 mln people. However, today, most countries are obliged to grant patents on medicines making such competition more and more difficult and the vast majority of these patents are not legitimate and don't comply with patentability criteria set internationally and nationally.

Patent oppositions is an effective instrument in removing patent barriers. Back in 2001 it was generic industry that filed patent oppositions to enable entrance of generics on the markets, but recently less and less interventions come by generic industry's initiative and civil society remains last stand in filing patent oppositions in MICs.

DESCRIPTION: Patent oppositions are technical and require involvement and teamwork of community leaders, lawyers and chemists, which is challenging for NGOs. To address it, experts from different fields should be jointly trained and mentored on how to do patent oppositions on medicines.

Within two regional Patent Oppositions Academy programs (POAs) 62 community leaders, lawyers and chemists from 13 countries were trained on steps for preparation of patent oppositions, practiced in groups prior art search and process of preparation of arguments. Using questionnaires a significant increase of knowledge was identified. After training, participants are involved gradually in opposition cases filed in different resource-limited countries by the Make Medicines Affordable consortium.

So far, 18 patent oppositions filed by Make Medicines Affordable campaign will generate savings of US $ 472 million for national HIV treatment programs.

LESSONS LEARNED: Participation in trainings of experienced mentors from local NGOs were instrumental in sharing experience and building connection with participants.

CONCLUSIONS/NEXT STEPS: As patent oppositions is a complex technical process involving team of experts with different competence, Patent Oppositions Academy have created an environment for building technical knowledge and dialogue between community leaders, lawyers and chemists. It is expected that POAs will help to increase number of patent oppositions filed in the countries by community leaders.

PEF1768

THE DEVELOPMENT OF DRUG PRICING PRINCIPLES TO STRENGTHEN EQUITABLE AND SUSTAINABLE ACCESS TO HIV AND HCV PREVENTION AND TREATMENT IN THE U.S.

T. Horn[1], A. Killelea[1], E. McCloskey[1]
[1]*NASTAD, Washington, United States*

BACKGROUND: Treatment and biomedical prevention advances have revolutionized our ability to end the HIV and hepatitis epidemics in the U.S. HIV treatment and biomedical prevention drugs, hepatitis C direct acting antivirals, and opioid reversal drugs are critical public health tools, and our ability to access them must be considered a public health imperative. Yet access in the U.S. has been inefficient, expensive, and profoundly inequitable.

DESCRIPTION: Federal, regional, and local efforts to end these epidemics serve as an important catalyst to approach drug pricing and access with the goal of achieving sustainable systems of treatment and prevention. The entire drug pricing and delivery system, including patients and providers, has a role to play in reducing drug prices and improving access. Using a highly consultative process involving policy, community, and public health stakeholders, NASTAD developed a set of drug pricing and access principles to address the health disparities that have fueled disproportionate access to healthcare in the U.S.

LESSONS LEARNED: Prescription drug prices, including out-of-pocket costs, can vary depending on the state, the purchaser, the type of public or private insurance coverage, and the disease. Inefficiencies in our current system lead to perverse incentives, notably a heavy reliance on artificially high list prices to ensure revenue streams for critical public health infrastructure. In turn, sustainable prescription drug access in the U.S. requires multi-faceted, evidence-based policy solutions to address treatment and biomedical prevention scale-up, high list prices and price increases, discriminatory payer formulary restrictions and cost-sharing requirements, inequitable access to prescription drugs developed with significant government and philanthropic investments, and significant reliance on manufacturer charitable contributions. Any solution to our drug pricing challenges comes with trade-offs, requiring community input and buy-in as we develop consensus for ethical and sustainable policy changes.

CONCLUSIONS/NEXT STEPS: High prescription drug pricing is a structural barrier to critical public health interventions in the U.S. Drug pricing principles tailored to address the unique biomedical prevention and treatment challenges among people living with or vulnerable to HIV and HCV should serve as a policy roadmap to ensure equitable and sustainable access.

CONCEPTUALIZING POLITICAL DRIVERS AND THEIR IMPACTS

PEF1769

IMPORTANCE OF USING VALUE BASED MODEL ON THE PREVENTION OF HIV RELATED ISSUES TO LOCAL POLICY CONTROLLERS WITHIN MUSLIM COMMUNITY: HIGHLIGHT FROM OUTCOMES IN MJINI, MERU COUNTY

F. Lalaikipian[1]
[1]*Kenya Methodist University, Computer Science, Meru, Kenya*

BACKGROUND: Various outcome from all stakeholders including government, civil societies, community based organization and non- governmental organization in their intervention to tackle the issue of preventing HIV new infections and stigmatization most use a number of approaches and models. They include youth centered approach, right based approach and participatory models. This has shown to reduce the number of new infections and stigmatization towards people with HIV in the communities. However the coverage at the ground community level especially for the Muslim community has been minimal. Health decisions for young Muslims are highly affected by religious and cultural policies. The direction given by their leaders also influences their take on this issues. The purpose of this research was to evaluate the influence of religious policies and religious leaders on youth in access to information and services about HIV.

METHODS: A study was done by Family Health Options in November 2019 in Meru, Mjini area on the influence of religion (Islam) and religious leaders on the influence they have on health decisions made by Muslim youths. The study was done to 23 religious leaders and 45 youths to evaluate their perception on HIV. FDGs and key informant interviews was the method of data collection used. SPSS toolkit was used to analyse the findings.

RESULTS: Outcome: The study showed that a big number of Muslim youths and religious leaders had vague information about HIV. This was influenced by religious inhibitions. That is why programs around value based approach were created to support sensitization of the epidemic. The sensitization led to incorporation of CSE session in Madrassa (religious schools). Organizations working to reduce the prevalence of the disease have involved this religious leaders to assist them in unpacking the Islam religion therefore enabling them to create relevant information toolkit and policies which has shown positive results.

CONCLUSIONS: To increase the impact of intervention to other local communities , making sure all the other religious leaders are sensitized on the HIV epidemic is key. Apart. This would help in creating value favorable interventions. Continuous monitoring and evaluation should be done to measure the impact of the interventions in the community.

POLITICAL VIOLENCE AND ARMED CONFLICT

PEF1770

EFFECTS OF TERROR ATTACKS AND VIOLENCE ON TREATMENT ADHERENCE AND PREVENTION OUTCOMES: CASE STUDY OF KENYA'S COAST

J. Aungo Bwonderi[1]
[1]*University of Nairobi/Centre for Research and Development, Sociology and Social Work, Nairobi, Kenya*

BACKGROUND: Studies show that violent conflicts disrupt and affect consistent health services access and uptake including HIV treatment and ANC. Coastal Kenya suffered terrorist attacks in 2014 prompting series of security interventions including militarization of parts of the region. Massive population dislocation resulted, especially in Lamu. The study aims to answer the question: Do these terror attacks affect HIV prevention, treatment and related services in Kenya? Using the Kenya case, the study examines how terrorism affects HIV-prevention/treatment services access/uptake and related outcomes. It hypothesizes that terrorism has a direct effect on HIV prevention and treatment services.

METHODS: The study adopted an ex-post facto design- studying the terrorism event long after its occurrence Steps: i. Identified and mapped 3 terror affected health facilities in Kenya's coastal region; ii. Extracted relevant HIV and ANC data from the DHIS entries of the selected facilities covering the period of January-December 2014; iii) Conducted analysis to test the hypothesis using selected key health access and outcome indicators.

RESULTS: The attacks engineer massive dislocation of people; enforcement of military and security curfews restricted movements including accessing hospitals. Folliwing violent attacks and insecurity incidents: i) health facilities lose key staff through transfers, relocation and death; ii) some health facilities close due to fear of attacks and reprisals (night services are stopped); loss of health service personnel and disrupted supply of essential commodities. Within months- eg July-September 2014) the following effects were observed: a) rapid decrease in HIV treatment service uptake which accelerated in July – 50% drop in key indicators; b) significant drop in ANC (1st/4th visits) service uptake (40%); c) HIV positivity rates surged three months after the attack-up to 20%.

CONCLUSIONS: Terror attacks negatively affect access and uptake of HIV treatment and ANC services by occasioning missed appointments, defaulting and dropout from treatment routines. This led to rapid and direct decrease treatment adherence; increased risky sexual practices including sexual violence (rape) thus rise in positivity. The link between terrorism and political violence versus access to ANC and HIV prevention and treatment deserves priority attention. As a result this will affect HIV treatment outcomes, increase eMTCT lapses and ultimately deaths.

FORCED DISPLACEMENT

PEF1771

ESTIMATION OF QUEER REFUGEE QUALITY OF LIFE GOALS IN URBAN-BASED SAFE SPACES OF KENYA, AUGUST 2019-DECEMBER 2019: INFORMING SERVICES TARGETING QUEER REFUGEES

T. Muyunga-Mukasa[1,2], D. Kabonge[3], Refugees Awaiting Resettlement
[1]Most at Risk Populations' Society in Uganda (MARPS in Uganda), Kampala, Uganda, [2]Advocacy Network Africa, Wellness, Human Rights, Research and Development, Nairobi, Kenya, [3]Refugee Independence Support Oganization, Wellness, Human Rights, Research and Development, Rongai, Kenya

BACKGROUND: LGBTIQQ identity, mixed with non-citizen status, social factors and personal choices impact security and safety of Queer refugees. The aim of the study was to characterize the factors influencing choices, perceptions and practices impacting quality Queer refugee health goals in Kenya.
METHODS: 59 Queer refugees were reached between August-December 2019 through respondent driven sampling; Key Informant, questionnaire administering, checklist analysis for Knowledge, Attitude and Practices were conducted. Arrival in Kenya in 2014 from Uganda, Congo, Somalia and South Sudan formed basis for eligibility (59 eligible out of 109).
RESULTS: All 59 ranked influences on health and wellness goals as follows: location (27), ease of integration in host community (59), living condition (32), social factors (20); refugee status (28), HIV status (30), drug-use (45), depression (25), daily life needs and income (50). The respondents are scattered in various Kenyan towns: Nyeri (9), Nakuru (6), Kisumu (5), Machakos (7), Mombasa (10) and Nairobi (22). Twenty (20) were staying in group homes called Shelters; 39 were staying with friends or in rented units. All 59 reported they used money to go toward rent, utilities, food security, transport fare, wellness needs and had UNHCR refugee status. 12 had drug or alcohol use disorders; 8 were living with HIV; All reported that at one time they depended on sex-work for survival. 15 had a steady income and last depended on sex-work 2 years back; 41 reported they earned most of their money from sex-work; 3 with mental depression still pick up stipends from UNHCR which is used to pay rent, nutrition, general welfare and transport for medical check-up.
CONCLUSIONS: Primary, secondary and tertiary influences on quality refugee life include: Local community integration was primary; financial, political, religious, social, cultural and legal factors were tertiary; and LGBTIQQ Identity, individual choices and practices impact one's safety and security were secondary. This research was based on self-reporting. Recall bias could have impended a more comprehensive narrative. Further research into how access to qualified service providers and one's qualifications for gainful employment can impact integration skills, interpersonal/intrapersonal skills is called for.

PEF1772

VIOLENCE AMONG LGBTQ REFUGEES IN URBAN KENYA AND KAKUMA CAMP 2019

K. Njokah[1]
[1]ISHTAR, Administrator Advocacy Person and Security Personnel, Nairobi, Kenya

BACKGROUND: By now humanitarian actors knows that LGBTQ refugees face particular risks of violence, in both camps and urban contexts because of their diverse sexual orientation, gender identity or presentation, or bodily diversity, LGBTI refugees face higher levels of discrimination and violence than that experienced by the general refugee population. kenya has been one of the country accommodating the LGBTIQ refugees mostly from Uganda ,Somali, Sudan and Burundi where by most refugees have have faced violence from they country and the country they receiving asylum from.
METHODS: Data and information for this study was obtained from sources: Published reports from CBOs and LGBTQ Refugee rights' bodies such as ROSCEA, ISHTAR MSM,REFCEA and data from police, court cases and other institutions by using the online reporting tool Utunzi: www.untunizi.com, a platform where LGBTIQ community report cases secondly interviews conducted on segment of the affected population, victims and survivors of violence at recovery centers, Medical reports.
RESULTS: Over 200 LGBTIQ refugees across Turkana and Nairobi reported facing heightened Violence risks because their sexual orientation and/or gender identity or presentation does not conform to main- stream expectations. The violence they reported ranged from verbal abuse on the streets, to being denied housing and employment, to physical abuse and rape by members of the host community and other refugees, to instances of fellow LGBTI refugees being killed. It is widely agreed that transgender refugees are most at risk, given their visibility and the strong transphobia that exists in many host countries and their countries of origin. Transgender refugees highlighted that having gender markers on their identity documents that do not match their gender presentation creates additional risks of violence for them, especially from service providers and police.
CONCLUSIONS: The need of policy makers and stakeholders be sensitized on LGBTIQ issues, need of international laws to be sensitization to the lGBTIQ asylum seekers, understanding laws in the country they seeking asylum from. Develop safe and anonymous feedback mechanisms and safe spaces for LGBTIQ refugees, so they can communicate protection gaps to UNHCR and its partners in ways that foster accountability while preserving refugees' confidentiality.

HUMANITARIAN CRISES

PEF1773

POST-DISASTER CRISIS INTERVENTION FOR PLWHIV: CRISIS RESPONSE PROGRAM FOR EARTHQUAKE ON PALU, INDONESIA

A. Prayuda[1], A. Riyadi[1]
[1]Indonesia AIDS Coalition, Jakarta, Indonesia

BACKGROUND: Crisis in Central Sulawesi Province was caused by an earthquake that caused tsunamis and liquefaction which resulted in severe damage to the infrastructure also caused difficulties in accessing ARVs due to service personnel who have also been affected by the disaster have not been active to work in the Service. Programs for post disaster crisis response for disaster victims, both patients with HIV and health workers who are also affected by disasters, this program ensure the availability of ARVs to continue treatment of people who had undergone ARVs, including psycho social support, and tracking PLWHIV who do not return to service.
DESCRIPTION: The program was implemented in areas affected by liquefaction and Tsunami disasters Central Sulawesi of Indonesia. it's carried out during the post-disaster period of 5 months October 2018

to March 2019. The activities carried out in this program include; Outreach of PLWHIV or patients for ARV access, Psycho social support for each key population, Psycho social support for Children with HIV, Shelter for ARV patients or key populations who are displaced, and logistic distribution for PLHIV and Children With HIV.

LESSONS LEARNED: This program reach 252 PLHIV on ARV in 3 Hospitals, there are 104 people who access ARV through the ARV Mobile Command Post, 66 and 67 people in 2 different services. This means that approximately 247 PLHIV can be sure to have received ARV services again. Based on these preliminary data, there are still a gap of about 5 people living with HIV who cannot be tracked. 85 people got psycho social support, and 16 new cases discovered, including 20 children.

CONCLUSIONS/NEXT STEPS: the HIV and AIDS service system was down, it was finally able to be overcome with the presence of the ARV Mobile command post so that it was able to move and run a the system at post-disaster. Difficult to access ARVs at the hospital because service personnel who are also affected by the disaster have not been served on service, but this can be overcome by the availability of ARVs at the post which then distributes them to people with HIV who start running out of ARVs.

PEF1774

ENSURING CONTINUITY OF CARE FOR PLHIV AND THOSE AT RISK IN CRISIS: USING MOBILE CLINICS TO PROVIDE INTEGRATED HIV CARE IN THE AFTERMATH OF 2019 FLOODING IN MALAWI

M. Phiri[1], J. Jere[2], N. Khozomba[3], E. Geoffroy[4], T. Schafer[5], K. Kondowe[6]
[1]Global Aids Interfaith Alliance, Mobile Health Clinics, Mulanje, Malawi, [2]Global AIDS Interfaith Alliance, Management, Blantyre, Malawi, [3]Global AIDS Interfaith Alliance, Programs, Blantyre, Malawi, [4]Global Aids Interfaith Alliance, Programs, San Rafael, United States, [5]Global Aids Interfaith Alliance, Programs and Administration, San Rafael, United States, [6]Phalombe DHO, Programs/Administration, Phalombe, Malawi

BACKGROUND: Sustained heavy rains in the lead-up to Cyclone Idai in March 2019 caused extensive flooding and widespread damage in Southern Malawi. Phalombe, where 16% of adults are living with HIV, was declared a disaster area with residents sheltering in displacement camps in need of medical care and treatment.

DESCRIPTION: The Global AIDS Interfaith Alliance, a nongovernmental organization, operates mobile clinics in Southern Malawi, including Phalombe. During flooding GAIA worked closely with the District Health Office to quickly mobilize resources to respond to the crisis. Working with the district's disaster response team, GAIA identified the need for urgent medical care, food, sanitation, HIV prevention efforts and ongoing care for people living with HIV. GAIA committed to share the cost of operating five weekly mobile clinic sites at each of the camps from March-July 2019. With available funding and additional district support, clinics continued operating 3 days per week through December 2019. GAIA was responsible for providing the clinic vehicle, fuel, driver, two nurses, and a nurse aide. The Phalombe DHO provided a nurse, an HIV diagnostic assistant (HDA) and medicines.

LESSONS LEARNED: Emergency relief clinic assisted 14,136 clients (78% female). 113 clients were screened/treated for STIs and 83 received HIV testing. The HDA tested 766 people at risk for HIV with 4 testing positive (all women) and linked immediately to care. 255 HIV+ clients were provided care for other ailments. We provided health talks on HIV prevention/treatment, sanitation, and other communicable diseases. The nurse-led clinic lowered operating costs and allowed for most clients to be screened and treated at the clinic and others referred when necessary.

CONCLUSIONS/NEXT STEPS: GAIA mobile clinic model enabled a quick response to the floods and concomitant urgent medical needs; the Phalombe DHO's commitment to support mobile clinics allowed for continuity of care for both acute and chronic conditions especially HIV, and helped avoid an outbreak of cholera. The flexibility of mobile outreach clinics to nimbly provide quality, efficient, cost-effective care in a high-HIV burden district provides a model for how to ensure continued care for populations at risk of climate crisis in geographies with limited resources for healthcare.

PEF1775

ASSISTING HIV VENEZUELANS REFUGEES IN COLOMBIA

j. valencia[1], L. Romero[2], C.A. Rodriguez[3]
[1]AID FOR AIDS, Programs, Manhattan, United States, [2]AID FOR AIDS Colombia, Programs, Medellin, Colombia, [3]AID FOR AIDS, Programs, Cali, Colombia

BACKGROUND: AID FOR AIDS (AFA) Colombia addresses the humanitarian crisis in Venezuelan by providing an effective response to alleviate the lack of attention to Venezuelan migrants and improve the health and welfare of migrants with HIV by minimizing the social impact and harmful health effects of the crisis. The program objectives are: 1) Establishing a network and strengthening programs and services dedicated to the prevention, treatment and care of Venezuelan migrants with HIV in the Colombian territory; 2) providing ARVs to migrants who hope to regularize their legal status, focusing on undocumented migrants. 3) Collecting data: number of Venezuelan migrants with HIV, and especially needs of ARV medicines in Colombia.

DESCRIPTION: This work is carried out through articulating efforts with Community-based Organizations, International Cooperation Agencies, Health entities and Institutions of the Colombian State, as well as specialized Volunteers HIV doctors. Furthermore, thanks to agreements reached with recognized laboratories, price reductions on CD4 and Viral Load tests have been achieved. AFA executes monthly ARV donations to the beneficiaries to ensure adherence to treatment and monitoring, we also do one-on-one adherence and group counseling through workshops. We provide ARVs mainly to the undocumented Venezuelan population while regularizing their legal status and being inserted into the Colombian health system. And to the documented Population with 3 to 6 months of treatment, while they are inserted into the health system.

LESSONS LEARNED: AFA has characterized more than 400 people, provided ARVs to 300 people, efforts that have led to the improvement in the health condition of beneficiaries. However, challenges remain in monitoring treatment and maintaining adherence to treatment due to the emotional and social problems they face as refugees.

CONCLUSIONS/NEXT STEPS: These efforts reiterate the need for developing a solid comprehensive care network in order to address not only medical conditions directly linked to HIV, but also psychological and mental health services. AFA's work in the region has been a successful response to the crisis and will scaled up in order to strengthen the service routes and expand them into other regions of the country.

SEXUAL- AND/OR GENDER-BASED INEQUALITIES, INEQUITIES AND VIOLENCE

PEF1776

CRISIS RESPONSE TEAMS: COMBATING VIOLENCE AGAINST SEX WORKERS IN SOUTHERN AFRICA

L. Pillay[1]
[1]North Star Alliance, South African Region, Pinetown, South Africa

BACKGROUND: Sex workers in Southern Africa are often confronted with violence and discrimination, with 70% claiming they'd suffered violence from a client, according to an Aidsfonds research study. Correlations between violence with decreased condom use and rises in HIV infections were also identified, highlighting the impact of violence on sex workers' ability to protect themselves from HIV, and maintain good sexual health. As a result, North Star Alliance's Crisis Response Team (CRT) intervention was established to address gender-based violence, strengthen access to sexual reproductive health and rights, and reduce risks of HIV exposure amongst sex workers.

DESCRIPTION: Embedded within an existing sex worker peer educator (SWPE) model, the CRTs employ a unique multi-sectoral approach, involving influential community representatives, human rights groups, local police, border control, North Star clinic staff and the SWPEs themselves. They provide a first responder system, which is deployed when a sex worker falls victim to sexual and gender-based violence, which in turn provides access to an integrated package of sexual and reproductive health (SRH) provision, including healthcare, legal and emergency services, without discrimination. SWPEs together with the CRT leaders are responsible for completing 'violence against sex worker' forms, which are used to monitor the number of cases reported to the authorities.

The formation of the CRTs has also been pivotal in mobilising and recruiting sex workers. In 2015, North Star mobilised 2,097 sex workers, compared with 11,034 in 2017 following the formation of the CRTs. In total, 93 cases of sexual and gender-based violence were documented during this period and as a result of the SWPE outreach and awareness raising efforts, sex worker visits to the eight clinics involved in the CRT initiative, increased from 14,756 to 41,032.

LESSONS LEARNED: Addressing violence against sex workers must fundamentally be human rights focussed, and works best when combined with a multi-sectoral approach towards improving SRH.

CONCLUSIONS/NEXT STEPS: By adapting a peer-educator outreach model in a healthcare setting, North Star has fostered meaningful involvement of community stakeholders to maximise sex workers' access to HIV and sexual reproductive health services. Plans are now underway to scale up CRT activities in East Africa using established SWPE networks.

PEF1777

AUDIT OF DRUG USE AND HIV POLICIES IN KENYA AND GHANA: A GENDERED LENS

C. Nyambura[1], D. Ankrah[2]
[1]ATHENA Network, Advocacy & Communications, Nairobi, Kenya, [2]Youth RISE, International Working Group Member, Accra, Ghana

BACKGROUND: Numerous studies have demonstrated link between intravenous drug use and HIV transmission. Generally the rate of HIV infection is high for people who inject drugs. However, young women are even more vulnerable in an ageist and patriarchal African society. For this reason, young women who use drugs especially face compounded challenges.

DESCRIPTION: Taking into account structural drivers of the epidemic and social determinants of health, 2 members of Youth RISE international working group collaborated to implement a project to understand the gender gaps in terms of policy and programming as pertains to treatment, care and support for adolescent girls and young women who use drugs. The overall goal of the project was to identify gaps that exist as far as women especially adolescent girls and young women who use drugs are concerned using a mixed method harm reduction approach that focuses on public health and human rights approach to bring about social change.

OBJECTIVES:

- To explore interventions in terms of policies, programs and research that targets the needs of adolescent girls and young women who use drugs
- To collaborate with young women who use drugs and to proffer recommendations to inform programming, policy making and research.

LESSONS LEARNED: - Kenya and Ghana have both passed policies on HIV prevention and drug use. However all of the policies are gender blind, to some extent they are borderline or explicitly discriminatory as relates to criminalization.

- Due to the legal and policy context, there is a general lack of interventions in terms of programs and research adolescent girls and young women who use drugs
- Where existent, services and programs focus on information provisions and referrals but not addressing systemic and structural barriers that sustain gendered discrimination.

CONCLUSIONS/NEXT STEPS: There is need for drug policy reform to be gender responsive and to be cognizant of realities of adolescent girls and young women. This aligns with the broader need for a more holistic and gender response HIV response that addresses risk and vulnerability in ways that nurtures resilience.

DEVELOPMENT AND POVERTY ALLEVIATION

PEF1778

WFP MULTI-SECTORAL SUPPLY CHAIN OPERATIONS ENHANCE THE QUALITY OF ETHIOPIA'S TRANSPORT INDUSTRY AND SUPPORT THE HIV RESPONSE

G. Giordana[1], M. Mumma[1]
[1]WFP, Nairobi, Kenya

BACKGROUND: Negative health trends such as HIV adversely affect transport corridors around the world. In Ethiopia while the national HIV prevalence is 1%, the prevalence among truck drivers and mobile and resident workers in hotspot areas is 4.9% and 1.5% respectively. The World Food Programme and the North Star Alliance supported the Ethiopia Federal Transport Authority HIV Unit in implementing a HIV prevention programme designed to foster healthy and safe supply chains. Its primary objective was to foster road safety and induce improved health outcomes by making services available to truck drivers and corridor communities.

DESCRIPTION: The Healthy Supply Chains programme was implemented through outreach activities between May and November 2019 in Modjo, Ethiopia's largest dry port. 42 peer educators, com-

prised of sex workers, drivers, mechanics and members of PLHIV associations, underwent a 5-day training to conduct outreach activities at pre-identified hotspots, such as truck parks, bars and lodges, where truckers congregate.

The outreaches, which included moonlight activities, offered services such as: HIV testing, counselling and referrals, STIs screening, condom demonstrations and distributions, nutrition assessment and counselling and linkages to income generating activities conducted by associations of PLHIV.

LESSONS LEARNED: A total of 3302 beneficiaries were reached. Among them 2100 were truck drivers, 850 were community members, and 352 were female sex workers. Overall, six truckers, 4 female sex workers and 3 community members tested positive to HIV and were referred for services.

Integrated HIV programming can strengthen regional supply chains and help communities become more resilient in facing health issues while stimulating the professionalisation of the transport sector.

Healthy supply chains foster sustainable transport corridors and a professional workforce directly enhancing the overall performance and cost efficiency of the country's transport industry.

CONCLUSIONS/NEXT STEPS: The transport sector plays a pivotal role in Ethiopia's macro and micro economic development: it sustains the country's ability to import and export goods and move economic inputs and outputs and enables individuals to move and trade ensuring they can generate income and sustain a livelihood.

Multi-sectoral programmes can foster a healthy and productive workforce to support returns on investment and contribute towards national economic development.

ACCESS TO EDUCATION

PEF1779

ACTIVATING COMMUNITY HIV PREVENTION FOR LATINO HOMELESS POPULATIONS: A STRATEGY FOR GETTING TO ZERO AMONG IMMIGRANTS

E. Siqueiros[1], J. Zepeda[1], R. Melendez[2]
[1]San Francisco AIDS Foundation, San Francisco, United States, [2]San Francisco State University, Sociology and Sexuality Studies, San Francisco, United States

BACKGROUND: Immigrant and homeless individuals are vulnerable populations hardly reached by HIV education and prevention programs. Immigrant communities living on the streets learn HIV concepts from word of mouth and often result in inaccurate information that could result in risks for HIV transmission.

DESCRIPTION: The San Francisco AIDS Foundation-Latino Programs piloted the Todos Somos Familia project, through the support of the 2018 Kaiser Permanente-Community Benefit Grant. It trained Latino homeless immigrant individuals as Health Activators in HIV Education/Promotores de Salud. A structured training was developed with the Activators input. The diverse life experiences from the Activators made a rich and yet challenging part of learning.

Many times the aspects of working with homeless individuals means lack of success due to lack of engagement. Project trainers became students of our participants and facilitated an activation learning epicenter among the project trainees. During the learning process, trauma, human suffering, and healing were unavoidable experiences. Practicing wellness and inclusion were part of the learning lessons we acquired in the project, as well tolerance, flexibility and understanding of social diversity.

LESSONS LEARNED: A total of 16 Latino homeless immigrants were trained as Activators. Working with homeless individuals is challenging. Our program was successful because we cultivated resilience among activators and allowed resilience to grow. We have none of the 16 activators leave the program during the duration of the study. the trainer of the promoters made it a priority to build a sense of comraderies and responsibility. The activators felt valued and respected. They saw the need for the program and were invested in making the program a success. They made 376 health education contacts with other Latino homeless individuals; 175 of those 376 individuals made a second contact with project staff and HIV screening referrals. Of those 175 who made a second contact with the San Francisco AIDS Foundation, 25 were absorbed into SFAF case management and another 49 entered into other services.

CONCLUSIONS/NEXT STEPS: Community Activation works and it is sustainable and a foundation of resilience! Community informed HIV Education activities are developed from the bottom up and promise success for Getting to Zero among marginalized communities.

CRIMINALIZATION, INCARCERATION AND LIVING IN CLOSED SETTINGS

PEF1780

CRIMINAL JUSTICE INVOLVEMENT AND SEXUAL RISK BEHAVIORS IN A SAMPLE OF BLACK WOMEN IN NEW YORK CITY: IMPLICATIONS FOR HIV PREVENTION AND CRIMINAL JUSTICE REFORM IN AN HIV VULNERABLE POPULATION

P. Marotta[1,2], N. El-Bassel[3], D. Goddard-Eckrich[3], K. Stringer[3,2], L. Beletsky[4], T. Hunt[3], A. Richer[3], J. Akuffo[3], E. Wu[3], L. Gilbert[3]
[1]Yale University, School of Medicine, New Haven, United States, [2]Brown University, Department of Medicine, Providence, United States, [3]Columbia University, New York, United States, [4]Northeastern University, Boston, United States

BACKGROUND: This study assessed relationships between criminal justice involvement (CJI), and sexual risk behaviors in a sample of Black women in community corrections in New York City (NYC). We hypothesized that contacts with police, feeling unfairly treated, and having sexual partners with recent incarceration would be associated with greater sexual risk behaviors with paying, non-paying and primary partners.

METHODS: Data included a sample of 356 Black women in community corrections collected from 2015-2018 in NYC. Generalized linear modeling estimated associations between CJI and relative risk (RR) of any condom-less sex with primary, paying and non-paying intimate partners and incidence rate ratio (IRR) of number of sexual partners using robust variance estimation.

RESULTS: Police questioning in the past year was associated with greater number of paying partners (IRR=4.93, CI95%=2.71, 8.96, p<.001) and risk of condom-less sex with paying partners (RR=2.44, CI95%=1.04, 5.73, p<.05). Feeling unfairly stopped, searched or questioned by the police was associated with greater number of paying partners (IRR=2.01, CI95%=1.02, 3.93). Greater number of male partners who were incarcerated was associated with greater number of

paying (IRR=1.55, CI95%=1.22, 1.97, p<.001) and non-paying (IRR=1.36, CI95%=1.15, 4.84, p<.001) sex partners, condom-less sex with paying (RR=1.14, CI95%=1.04, 1.24, p<.001) and non-paying sex partners (RR=1.21, CI95%=1.09, 1.34, <.001). Drug court participation was associated with increased incidence of number of paying (IRR=2.59, CI95%=1.28, 5.27, p<.008) and non-paying partners (IRR=2.34, CI95%=1.45, 3.82, p<.001) and risk of engaging in condom-less sex with paying partners (RR=2.72, CI95%=1.23, 6.05, p=.013). Prior conviction for disorderly conduct (RR=2.87, CI95%=1.27, 6.52, p=.012), drug law violation (RR=2.47, CI95%=1.11, 5.51, p=.026) and prostitution (RR=3.67, CI95%=1.37, 9.88, p=.010) was associated with greater risk of engaging in condom-less sex with paying partners.

CONCLUSIONS: Findings from this study underscore the importance of increasing access to HIV prevention resources for Black women in the United States. Criminalization of drugs and sex trading coupled with the disproportionate policing and prosecution of black women may contribute to racial and ethnic disparities in HIV infection among black women the US. Structural interventions involving criminal justice reforms may reduce racial disparities in HIV infection among black women in the United States.

PEF1781

RACIAL AND GENDER DISPARITIES IN FLORIDA NEWSPAPER COVERAGE OF HIV RELATED ARRESTS

W. Deihl[1], S.-E. Brown[1]
[1]*Rollins College, Global Health, Winter Park, United States*

BACKGROUND: According to the Centers for Disease Control and Prevention (CDC), as of 2016, 108,003 people live with HIV (PLHIV) in Florida, which also has the highest rates of new HIV diagnoses in the country. Numerous complexities worsen Florida's HIV risk environment, including sex work, human trafficking, injection drug use, and sex tourism. These topics are often bases for HIV-related arrests that journalists cover. HIV criminalization describes statutes that criminalize otherwise legal conduct or that enhance penalties for illegal conduct based on a person's positive HIV status.

METHODS: This study employed a systematic review of Florida news articles on HIV-related arrests published between 2009-2019. Through qualitative content analysis, our study analyzed how race, gender, and journalistic tone coalesce in reports of HIV-related arrests.

RESULTS: A 2018 report from the Williams Institute indicated that white Floridian women are primarily arrested for HIV-related crimes. The systematic review found zero news reports on HIV-related arrests of white Floridian women, and only one article identified a female perpetrator whose race was undisclosed. Sixty-four other articles reported solely on the HIV-related arrests of men, predominantly black men. We identified two categories of articles where HIV was either central to the arrest, or the person's HIV-positive status was reported but exhibited little pertinence to the arrest.

CONCLUSIONS: Journalistic and police reporting behaviors risk inadvertently stigmatizing PLHIV at a time when public awareness of HIV depends on perceptions of HIV. This information will be used to shape equitable local nonprofit campaigns for community prevention, and HIV decriminalization efforts, while also combating the perpetuation of HIV misinformation.

LAW ENFORCEMENT AND PUBLIC HEALTH

PEF1782

ADVOCACY CAMPAIGN TO ENHANCE HARM REDUCTION SERVICES IN MOMBASA COUNTY: EXPERIENCE AND LESSONS LEARNED

A. Karisa[1]
[1]*Reachout Centre Trust, Harm Reduction, Mombasa, Kenya*

BACKGROUND: Drug use and possession remains illegal in Kenya through the enactment of narcotic drugs and psychotropic substances (control) act 1994 (Cap 245). This act makes many drug users vulnerable to infectious diseases, HIV, Hepatitis, another sexual transmitted disease. The same act is used to prosecute drug users and those on possession of drugs and paraphernalia.

DESCRIPTION: In 2016, Reach out Centre Trust(RCT) through the United Nation Office On Drugs and Crime (UNODC) and Open Society Initiative for Eastern Africa (OSIEA), funding conducted a three days conference for the 70 Criminal Justice system(magistrates, Court clerks and registrars, probation officers and judges) on Human rights, methadone and harm reduction, Training's and sensitization meetings for 150 senior police officers and 80 county police on human rights, the negative impact of criminalization on people who use drugs and Harm Reduction. 2 exchange visits for 6 senior police officers to Keeping Alive Society Hope (KASH) organization to learn on the best practices on Harm reduction.

This strategy was to convince the law implementer s aware of developments and benefits of harm reductions and realization of drug use as a public health issue. Secondly, was to convince the criminal justice system that the punitive laws impedes human rights and access to HIV services. Other advocacy strategies used includes; Police stations visits and collaborations with Governor's office, Area members of the parliament and Members of County Assembly of the region.

LESSONS LEARNED: By 2019, 5314 (3978m&1336f) PWUDs were given alternative sentence while 2090 (1810m&280f) PWUDs were referred to RCT for drug treatment on methadone and drug treatment centers. 3409 (2980m&429f) PWUDs were released on police custody unconditionally.54 (45m&6f) incarcerated persons on opioid dependent access Methadone medication at Kisauni Methadone clinic and Kombani MAT clinic in Mombasa and Kwale counties. RCT is a stakeholder in the Court Users Committee (CUC) and Prisons Discharge Board. Minimal arrests and raids have been noticed. The Kenya President directed the war on drugs to drug Barons.

CONCLUSIONS/NEXT STEPS: RCT experience suggests that partnership with criminal justice systems and other law implementer s and makers can enhance uptake of HIV services, improve PWUD wellbeing and end decriminalization of the PWUD community.

PEF1783

#DRUGREFORMNOW – 21ST CENTURY CROSS-SECTOR CAMPAIGNING FOR RADICAL CHANGE IN SCOTLAND

D. Morris[1], N. Sparling[1]
[1]*HIV Scotland, Edinburgh, United Kingdom*

BACKGROUND:
Drug-related deaths in Scotland are the highest in Europe. Injecting cocaine, and the associated risks and behaviours, has led to one of the largest HIV outbreaks in Europe among people who use drugs, which has been ongoing since 2015. The power over the laws that govern drug use in Scotland is reserved to the UK Parliament. A general election was called for 12th December 2019.
DESCRIPTION: A cross-sectoral partnership of Non-Governmental Organsiations (NGOs) developed a campaign for prospective parliamentary candidates and political parties to ask them to commit to reforming laws surrounding drugs. The main ask of the campaign was for a future Government to support taking a public health approach to drug use, as opposed to the current criminalisation of people who use drugs. This would have multiple benefits, including giving the Scottish Government the power to open a Drug Consumption Room to support a reduction in new HIV diagnoses.
LESSONS LEARNED: Out of 230 candidates standing for election, 101 prospective parliamentarians signed the #DrugReformNow pledge. The First Minister of Scotland, Nicola Sturgeon MSP also supported the campaign as the leader of the Scottish National Party. Following on from the election, 40 out of the 59 MPs have supported the #DrugReformNow campaign and at one of the first sessions of Prime Minister's Questions, the Prime Minister was asked to support the campaign to enable a Drug Consumption Room to open in Scotland.
CONCLUSIONS/NEXT STEPS: During an intense general election campaign, it can be difficult for NGOs to break through with specific issues. The #DrugReformNow campaign was supported by candidates from every party and had a high level of engagement. The campaign helped to challenge stigma around drug use and people who use drugs. A majority of Scottish MPs support drug law reform, which is a major success. The cross-sector partnership of NGOs helped to make the campaign a success, reaching more people and amplifying the campaign. The next steps of the campaign are to continue to increase the pressure on the UK Government to act in order to reduce drug deaths and new HIV transmissions.

AVAILABILITY AND ACCESS TO HARM REDUCTION (INCLUDING OST AND NSP)

PEF1784

SILENT CRISIS: UKRAINIAN HARM REDUCTION COMMUNITY IS IN DESPAIR WHEN FACED WITH REALITIES OF ANNOUNCED "SUCCESSFULL TRANSMISSION TO NATIONAL FUNDING"

K. Liezhentsev[1], K. Zverkov[1]
[1]*NGO - Era of Mercy, Odessa, Ukraine*

BACKGROUND: During last 5 years Ukraine has been internationally accepted as a case model for successful transmission to national funding from GFATM projects. Yet, the striking succes of PLWHA's activists advocacy that resulted in effective price reduction in 2007-2011, ongoing sustainable work on reforming and capacity building of National Procurement System, changes in narcotic drugs regulations done by Principla Recipients has resulted in effective ARV procurement by the state in 2014 and complete taking over of ARV treatment for more than 150 thousands patients by 2017.
In 2019 Ukraine has been celebrating the first budget allocation for the support of Programs on HIV prevention in vulnerable groups and establishment of National Center for Public Health (NCPH), a new structure that is responsible for operating more than 83 mln UAH (3 458 333 USD) for HIV prevention and care activities.
DESCRIPTION: More than 50 Harm Reduction organizations that had participated in national tender and national LGBT leader, "Liga", have raised their questions about the critical barriers for project implementation and even existence of NGOs:
- national legislation that automatically makes any NGO that provides services under national funding a WAT payer. 20% of WAT undermines budgets of organizations and also puts them under huge risk of penalies from the side of fiscal organs (that they simply can not pay from any of their budget costs);
- Ukrainian Tax legislation has special articles about WAT-free services however there nothing in the list about NGOs working in the field of TB, HIV.
- Both NCPH and Principal recipients withdraw themselves from any expert assistance on the issue and ignore multiple applies from grass-root organizations.
LESSONS LEARNED: There is a need to launch an informal union of HIV-service experts to provide assessment and ensure effectiev dialogue to address any future legislative, programmatic and policy issues in terms of effective and sustainable programming of HIV in Ukraine.
CONCLUSIONS/NEXT STEPS: On behalf of Harm Reduction community of Ukraine we call upon international society to assist us:
- provide expert support to our advocacy;
- provide assessment of current tax legislation;
- developing Guide on realities of transfer to national budget.

PEF1785

TRANSITIONAL FUNDING OF THE PROGRAMS TARGETING PWID IN UKRAINE

L. Legkostup[1], K. Mangatova[1], V. Akbirova[1]
[1]*State Enterprise Center of Public Health of the Ministry of Health of Ukraine, Kyiv, Ukraine*

BACKGROUND: Programs on harm reduction and prevention of HIV infection among injecting drug users in Ukraine, as a low-income country, were funded solely by international donors. Prevention programs were not financed by state. This created the preconditions for instability of service delivery and dependence on donor funding.
Since 2019, Ukraine has stepped up national funding for its own response to a more sustainable response to HIV. This became possible due to implementation of the Transition Plan from donor to state funding.
DESCRIPTION: In 2019, Ukraine has become the first country in Eastern Europe and Central Asia that undergoes transitional funding for HIV prevention services. The transition process is scheduled on 3 years. To ensure state funding, the government approved a series of legal acts regulating the procurement of prevention services at the expense of the state budget, namely, the Procedure for providing

HIV prevention services among representatives of high-risk groups and methods of calculating marginal tariffs on delivering HIV-related services.

The structure of HIV prevention services for PWID is designed to form sustainable behavioral changes that reduce risky behavior, thus leading to harm reduction and improvement of their health and quality of life. Among core services are providing targeted informational, educational and communication interventions; distribution of condoms and lubricants; syringe exchange; HIV testing.

LESSONS LEARNED: In 2019, the state budget has allocated funds to provide prevention services among PWID for 150,281 persons and to provide HIV-related medical care and adherence support for 1 975 people with HIV. OST programs covered 11,385 people, 27.4% of the assessed need. As of December 31, 2019, 164357 consultations, 170011 syringe exchange cases, 47616 HIV tests and 53615 TB screenings were provided to PWID.

CONCLUSIONS/NEXT STEPS: In 2020, the state program funding is increased by 23%. The estimated number of PWID who will receive HIV prevention services is 194,264 persons, the engagement of new PWID for providing HIV-related medical care and improvement of adherence is 4,680.

This positive trend in shifting to more pronounced state funding has a lot of advantages for Ukraine. They include fostering ownership and accountability in the implementation of the national HIV response and increasing their sustainability.

PEF1786

STRENGTHENING HARM REDUCTION IN EASTERN AFRICA THROUGH STRATEGIC POLICY

S. Ayon[1]
[1]*KANCO, Community Systems Strengthening, Nairobi, Kenya*

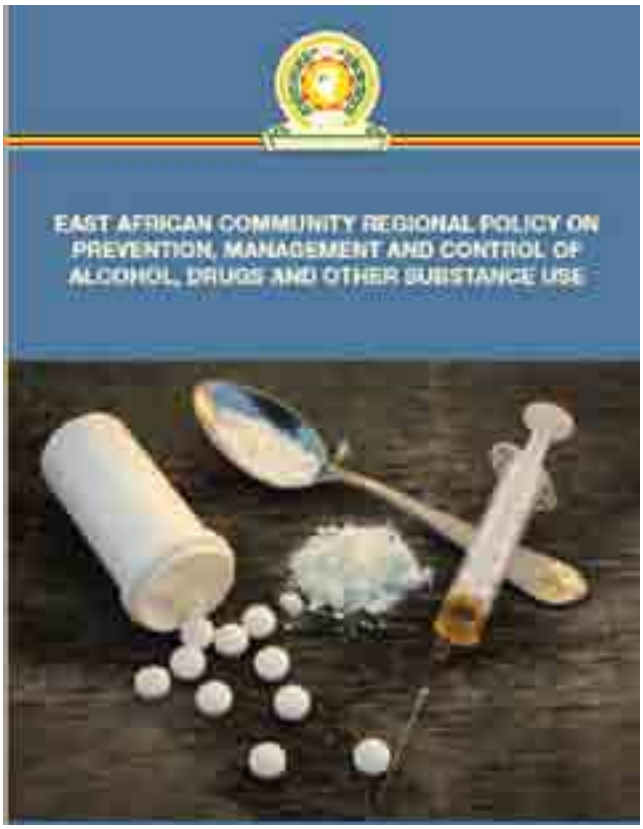
BACKGROUND: East Africa is home to about 150 million people, 260,000 among them being people who inject drugs. This constitutes about a fifth of the population of people who use drugs in Africa and growing. Eastern Africa region is recorded as a drug transit route with use of drugs for recreation. Consequently this has fueled the growth of the HIV epidemic standing at about 18%, arising from the sharing of injecting equipment and related sexual behavior.

DESCRIPTION: In October 2015,KANCO supported by the Global Fund through the Regional HIV and Harm Reduction Project, embarked on a journey to introduce and cement harm reduction in eight Eastern Africa countries. Prohibitive policy environment, irregular capacity of professional service providers and limited information on harm reduction characterized the terrain. KANCO in partnership with the East African Community (EAC) Secretariat and eight country implementing partners embarked on developing a policy to address 5 broad policy areas:

Data collection to inform Harm Reduction, Developing national harm reduction policies, Delivering interventions to people who use drugs, strengthening the capacity of PWUDs across EAC as well as creation of a supportive legal environment.

LESSONS LEARNED: Policy development is a long journey that takes at least two years. The consultative process navigates various stages both at regional and national levels. This includes the literature review and data collection to draft a comprehensive situational analysis; the formulation of the draft policy document; country consultations; experts' meetings and peer review consideration, regional validation of the final draft and Ministers approval.

CONCLUSIONS/NEXT STEPS:



On 26th March 2019, EAC council of Ministers approved the attached policy. It gives platform for sensitization, advocacy and access to services and calls to the member countries stakeholders to adopt, sensitize and promote its understanding for effective application to bridge the service gap for people who use drugs in the region.

PEF1787

ACHIEVING SAFER INJECTING PRACTICES: SHIFTING DRUG RESPONSES AWAY FROM A HOSTILE NATIONAL POLICY CONTEXT AND TOWARDS THE LOCAL

D. Gold[1], N. Dhumma[1]
[1]*National AIDS Trust, London, United Kingdom*

BACKGROUND: HIV among people who inject drugs has been low since the 1980s (currently 1.7%) but a shift in drugs policy coupled with cuts to drug treatment services has compromised this. Scarce harm reduction services were a key contributor to a recent HIV outbreak in Glasgow. Drug-related deaths in the UK are at an all-time high. Since national Government is adopting a punitive, abstinence-based approach NAT chose to focus instead on change at a local level.

DESCRIPTION: We sent 40 local authorities experiencing particularly high rates of drug-related deaths Freedom of Information requests to understand their response and then tracked their progress in navigating the legal and policy barriers to effective harm reduction, for example, drug consumption rooms (DCRs) - currently not possible in UK law. We mapped common challenges, responses and successful strategies.

With little interest from the Home Office in harm reduction NAT coordinated with allies and undertook advocacy with sympathetic parliamentarians; submitting evidence to the Health and Social Care

Committee's inquiry into drugs. In October 2019 the Committee recommended increased investment, moving drugs policy into public health and DCRs. In November the Scottish Affairs Committee echoed these recommendations and called for the UK government to devolve the relevant policy area to the Scottish government.

LESSONS LEARNED: We have used the government's localism agenda to push for local autonomy in drug responses. 15% of local authorities we spoke to expressed interest in setting up DCRs but were concerned about prosecution. While the safest option is a change to the law, we identified other solutions that could be in place via agreements between local policing and health stakeholders. There is a precedent, with examples of these are now being advocated for through local leadership, courage and innovation such as in Glasgow.

CONCLUSIONS/NEXT STEPS: This is a turning point for harm reduction in the UK. Without authorisation from the government nor indication of support, local leaders are working outside of the law to establish DCRs in order to test out how it will respond. By tracking, supporting and amplifying these small-scale interventions NAT is working from the bottom up to impact national policy.

SAFE HOUSING, SOCIAL PROTECTION AND OTHER CARE AND SUPPORT FOR PEOPLE AFFECTED BY HIV

PEF1788

UNSTABLE HOUSING AND HIV PREVENTION PRACTICES AMONG LATINX MEN WHO HAVE SEX WITH MEN IN PUERTO RICO

E.I. Santiago-Rodríguez[1], C.E. Rodríguez-Díaz[2], C. Zhang[2], S.M. Malavé-Rivera[3]
[1]University of California, Division of Prevention Science, San Francisco, United States, [2]George Washington University – Milken Institute School of Public Health, Department of Prevention and Community Health, Washington, DC, United States, [3]University of Puerto Rico, School of Public Health, San Juan, Puerto Rico

BACKGROUND: The relationship between homelessness and HIV has been widely documented. Studies have highlighted the impact of homelessness and HIV testing and care outcomes and less focus have been placed in understanding how the diverse levels of unstable housing (not being able to pay rent, residential transients, living in public housing, SROs, shelters) affect HIV testing and risk practices. Our study examined self-reported experiences of unstable housing and how it relates to HIV prevention practices among Latinx MSM in Puerto Rico (PR).

METHODS: In June 2017, data about HIV prevention practices and socio-behavioral characteristics were collected from an online sample of 256 Latinx MSM. Eligibility criteria were Spanish-speaking MSM, ≥18 years, self-reporting HIV-negative, and residing in PR. The primary outcome was the self-reported experience of unstable housing and concerns of losing their homes in the following months. Bivariate analysis was used to understand the relationship between unstable housing, HIV prevention (i.e. testing), and risk practices (i.e. condomless sex and no PrEP use).

RESULTS: Participant mean age was 30.5yrs. Most lived in non-metropolitan areas (56.7%), had completed at least high-school (92.58%), were employed (73.05%) and had an annual income of <$20,000 (57.42%). Most had ever tested for HIV (92.6%). Overall,12.1% of participants had ever been without a safe place to live and 27.7% had concerns about losing their home in the following months. Participants with experience of not having a safe place to live were less likely to test for HIV in the next 6 months (p-value=0.0094) and more likely to engage in risky sexual practices (p-value=0.0241). Furthermore, participants with concerns about losing their home in the following months were more likely to report recent (last 90 days) risky sexual practices (p-value<0.001).

CONCLUSIONS: Findings suggest that not only the experience of not having stable housing but concerns of not having a safe place to live in the future might influence HIV prevention practices and risk practices among this group. It is necessary to develop research the looks more in-depth into this relationship and that informs structural and culturally-relevant interventions to mitigate the risk of HIV for people who experience unstable housing.

ACCESS TO APPROPRIATE HEALTHCARE SERVICES (INCLUDING FOR CO-INFECTIONS AND CO-MORBIDITIES)

PEF1789

HIV TREATMENT IN MOROCCO AND LEBANON FROM PERSPECTIVE OF RECIPIENTS OF CARE

A. Hajji[1], O. Mellouk[1], M. El Harrar[1], A. El Geddari[1], Z. Bahtout[1]
[1]ITPC MENA, Advocacy, Marrakech, Morocco

BACKGROUND: Little is known about delivery of HIV treatment today. ITPC-MENA joined in 2018 a multi-country study to assess the current state of HIV treatment delivery and document the various challenges and barriers faced by PLHIV to access the continuum of HIV care and treatment. The study was conducted in Morocco and Lebanon.

METHODS: Survey participants were randomly selected from seven different health care facilities providing HIV-related services in Lebanon (N = 63) and Morocco (N = 300). A quantitative survey assessed access and barriers related to HIV care and access to treatment through questionnaires. Qualitative interviews have been conducted with representatives of people living with HIV (PLWHIV), health workers and government officials selected at each site in the country to assess challenges to accessing and providing HIV care.. Fifteen interviews were carried out in total (six in Lebanon and new in Morocco).

RESULTS: The results reveled that HIV services in Lebanon depend mainly on the private sector where 98.4% receive their treatment, which creates a barrier for monitoring and achieving the 90-90-90 targets. Anti retroviral therapy is free in both countries, however, lab tests and treatment for opportunistic infections had to be paid for by patients.

35% of participants in Morocco said that they stopped ART because they did not have the financial resources to go to the treatment center. In Lebanon, funding for tests is a major challenge, while in Morocco, shortages of drugs and incomplete test kits are urgent. Self-stigma was high among respondents in Morocco, since 61% of respondents (N = 183), blamed themselves more than once for being infected with HIV.

CONCLUSIONS: Despite progress to improve treatment coverage and quality in the MENA region, our survey reflects persistent access gaps and gaps in the quality of care for people living with HIV. Based on the findings of the study, the international treatment preparedness coalition (ITPC) team made several recommendations to address these gaps.

ACCOUNTABILITY ON THE HIV RESPONSE

PEF1790

TRACKING ACCOUNTABILITY AND EFFECTIVENESS IN NIGERIA'S GLOBAL FUND AIDS, TUBERCULOSIS AND MALARIA SUPPORTED PROJECTS AND NIGERIA'S COUNTRY COORDINATING MECHANISM (CCM)>

F. Umoh[1], T. Oyedemi[2], A. Adegoke[1]
[1]*Positive Action for Treatment Access (PATA), Program, Ikeja, Nigeria,*
[2]*Positive Action for Treatment Access (PATA), Administrative and Finance, Ikeja, Nigeria*

BACKGROUND: Nigeria since 2002 has received over US $1.4 billion from the global fund making the country the greatest recipient. With this funding about 750,000 Nigerians with HIV have access to treatment, 310,000 tuberculosis cases detected and treated, over 93 million mosquito nets distributed. Despite these accomplishments, challenges of accounatbility and transparency in the management of funds still exist as highlighted in the 2011 and 2016 audit reports from the global fund office of the Inspector General. This abstract presents efforts by Nigeria's civil society health watch to demand accountability and transparency in global fund supported HIV projects in Nigeria.

DESCRIPTION: Nigeria civil society health watch is modeled after the Africa Health Watch and the global fund observer program. Comprised 60 civil society organizations and committed to five main tasks. These are: provision of directory of CCM representatives and grant recipients and services they offer; ongoing dialogues with CCM members and principal recipients about improved services and value for money;; independent civil society monitoring of global fund sites and documentation of findings; facilitating connections between end users and implementers to promote proper utilization of funds, quartely publications of findings via news letters.

LESSONS LEARNED: The civil society health watch mechanism is effective in engaging broad stake holders' participation in monitoring the use of funds and programming. A good strategy to help communities understand how global fund works in country and help end users find access to global fund supported treatment and services. Effective platform for sharing information on the significance of grant performance.. Useful in tracking deliverables by principal and sub recipients across various sites in relation to funding received and quality of service received by end users.

CONCLUSIONS/NEXT STEPS: There is need for increased effort to ensure grants provided for poor and middle income countries achieve the desired result for the end users. This will scale up efforts to prevent and treat HIV, TB and malaria. We recommend more civil society health watch mechanisms. Organizations involve in the watch dog role should not at the same time be principal or sub recipients of funds they are tracking.

PEF1791

THE WAXING AND WANING OF CIVIL SOCIETY SPACE IN THE HIV RESPONSE

L. Ferguson[1], S. Gruskin[1]
[1]*University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States*

BACKGROUND: Civil society plays well-recognized and critical roles in the HIV response –including as service providers, advocates, researchers, governmental watchdogs. Government actors, for good and for bad, not only play a large role in shaping the response but create the environments within which civil society can operate. When there is alignment in goals and expectations, this works well (e.g. service delivery to hard-to-reach populations); at other times the dynamic between these groups becomes complicated (e.g. civil society pressure on government to fulfil legal and human rights commitments).

DESCRIPTION: In conducting a series of multi-country evaluations of HIV programs across sub-Saharan Africa in recent years, the expansion and contraction of civil society spaces has been particularly striking. We sought to better understand factors influencing these changes.

LESSONS LEARNED: Neither government nor civil society is monolithic and yet the action of whatever part of government regulates civil society space (e.g. Ministry of the Interior) affects how all civil society can act, including how they can collaborate with other parts of government (e.g. Ministry of Health).

When there is conflict, e.g. when legal intervention is sought to pressure government to augment efforts to address HIV, regardless of the court ruling government more broadly may respond by making it difficult for NGOs to operate e.g. by limiting the channels through which they can receive funding or exacting demanding and/or expensive registration processes. Similar barriers may also be erected by governments in response to donor funding being channeled directly to civil society actors, particularly when at the expense of direct budget support to government.

CONCLUSIONS/NEXT STEPS: The importance of the different roles played by government and civil society in the HIV response is undisputed. Sometimes they work in partnership with shared goals and sometimes in direct opposition. In this time of deep and polarized political division, and decreasing funding for HIV, it is critical that governments and civil society continue to find ways to collaborate constructively even when one feels attacked or constrained by the other. A sense of mutual accountability is required to ensure that an effective HIV response remains the joint priority.

PEF1792

THE GLOBAL FUND REPLENISHMENT CONFERENCE (FRANCE, 2019): A SUCCESSFUL AND GRADUATED MOBILISATION FROM COMMUNITIES AND CIVIL SOCIETY

J. Pasteur[1], N. Boumendil[1], E. Poultreniez[1], A.-C. Chéron[1], J. Spiri[2], G. Féménias[2], J. Chalon[2], J.-B. Lusignan[2], B. Vibert[2], A. Toullier[1]
[1]*AIDES, Pantin, France,* [2]*Crips Île-de-France, Pantin, France*

BACKGROUND: In order to generate a financial and political mobilization from donor countries, the community-based organization AIDES and the Paris Regional Centre for AIDS Prevention (CRIPS-IDF) raised civil society awareness before the Global Fund Replenishment Conference (GFRC) that has been held on October 9th-10th 2019, in Lyon.

DESCRIPTION: During fall 2018, an activist working group from AIDES has been set up to build a strategy and produced internal & external mobilization tools. Taking opportunity of the NGO local events, 2100 activists were trained on GFRC issues on how to inform the general public and their communities about the GF. In September 2019, the "Red Ribbon Loop" (*Boucle du Ruban Rouge* – BRR) operation, initiated by the CRIPS-IDF with AIDES' support, gave visibility to the GFRC across France. These distinct sequences were supported by a massive media campaign launched by AIDES, in May-August 2019, and in September-October 2019.

LESSONS LEARNED: This mobilisation, targeting stakeholders and communities, increased the visibility of the issues related to the global fight against HIV, in favour of common goals:

1) among CSOs: launch of a petition supported by more than 50 associations for World AIDS Day 2018 ;

2) through communities: speeches from spokespersons from Global Fund recipient organizations during communities' "key dates" on March 8th (Women), May 17th (LGBTQ) and June 26th (PWUD) and during Pride Walks in France, AIDES' Congress in June 14th and the GF Replenishment Conference itself in Lyon ;

3) among general public: using public space, traditional and social media, giving a strong visibility of the media campaign (258 media clips) and during the 33 steps of the BRR ;

4) towards elected officials: during the BRR, many elected officials made public commitments and/or shared our demands including the Mayors of Paris and Lille as well the Presidents of the northern region, and Paris region, and several MPs.

CONCLUSIONS/NEXT STEPS: With a graduated and progressive action strategy, AIDES, the CRIPS-IDF and their partners have contributed to the success of the GFRC, being the most important fundraising for global health with USD 14 billion raised and especially a 20% increase for the French contribution, and involving over 1000 participants.

PEF1793

PERFORMANCE OF STATE AND NON-STATE IMPLEMENTERS OF GLOBAL FUND-SUPPORTED HIV GRANTS IN SUB-SAHARAN AFRICA: A COMPARATIVE ANALYSIS

A. Ithibu[1], S. Muniu[1], D. Amendah (PhD)[1]
[1]*Aidspan, Nairobi, Kenya*

BACKGROUND: The Global Fund to fight AIDS, tuberculosis and malaria spends nearly $4 billion per year fighting those diseases. It invests more than 70% of these funds in sub-Saharan Africa. Global Fund channels its monies either through state or non-state entities, where the state entities or Principal Recipients (PRs) such as the Ministries of Health or Finance manage the largest proportion of the grants in sub-Saharan Africa. Grants managed by state entities use national systems such as the public financial management systems and human resources. This analysis seeks to determine whether there is a difference in performance between the state and non-state implementers of Global Fund grants and identify opportunities for improvement through enhanced accountability.

METHODS: We obtained data from the Global Fund databases, available on its website, related to active Global Fund-supported HIV grants in sub-Saharan African countries over the 2017-2019 funding cycle. Information obtained included grant signed amounts, type of implementer, and grant performance as shown by recent grant ratings. The Global Fund rates grants as either having exceeded expectations (A1), met expectations(A2), adequate (B1), inadequate but potential demonstrated (B2) or unacceptable (C). The final analytical sample consisted of 64 active grants from 41 countries amounting to $4 billion.

RESULTS: Slightly less than half of the active grants (31) were state-managed and amounted to $2.6 billion. The majority (77%) of these state-managed grants received a B1 rating, whereas only five of the 31 (16%) received A rating. In contrast, 44% of non-state managed grants received an A rating while only 42% received a B1 rating. Preliminary analysis showed that there was a significant difference in performance between the state and non-state implementers. State PR-managed grants are almost five times more likely to receive a B1 or B2 rating than an A rating, as compared to the non-state actors (p=0.009).

CONCLUSIONS: In sub-Saharan Africa, non-state implementers of Global Fund HIV grants perform better than the state implementers. Thus, in-country accountability structures such as Supreme Audit Institutions and the Country Coordinating Mechanisms (CCMs), need to step up and monitor and oversee state grant implementation and promote accountability for these funds

HUMAN RIGHTS OF PEOPLE LIVING WITH HIV AND KEY AND VULNERABLE POPULATIONS

PEF1794

PROTECTIVE SHIELD OR PUNITIVE SWORD?: A CRITIQUE OF THE UGANDA HIV AND AIDS CONTROL AND PREVENTION ACT, 2014 FROM A HUMAN RIGHTS PERSPECTIVE

R. Mayanja[1], P. Emong[2]
[1]*Uganda Martyrs University, Humanities and Social Sciences, Kampala, Uganda,* [2]*Uganda Martyrs University, Kampala, Uganda*

BACKGROUND: The purpose of the research: To assess the compliance of the Uganda HIV and AIDS Control and Prevention Act, 2014 (the Act) with international human rights law standards.

Problem: In 2014, the Government of Uganda enacted a law to control and prevent HIV and AIDS. However, human rights advocates contest that the law contains provisions that don't comply with international human rights law standards.

METHODS: Study period: August 2014 - August 2015

Study design: Qualitative design.

Data collection: The study used a document analysis method.

Method of analysis: The study identified international human rights law standards related to HIV and AIDS and used them as benchmarks for the review, analysis and synthesis of the literature.

RESULTS: The study established that: The Act carries provisions that comply with international human rights law standards. These include HIV counselling, testing, and treatment; state responsibility in HIV and AIDS control; the establishment of the HIV and AIDS Trust Fund; HIV-related human biomedical research; and prohibition of discrimination in various settings on grounds of HIV status.

The Act also contains provisions that are not compliant with international human rights law standards. These include mandatory HIV testing, disclosure without consent, criminalization of actual and attempted HIV transmission, and criminal penalties for vaguely defined conduct.

The Act lacks provisions that would make it more effective in controlling and preventing HIV and AIDS. These include commitments by the state to be accountable for its obligations stated in the Act; definition of what constitutes discrimination in various settings; and addressing challenges such as the causes of discrimination, inadequate professional human resources at health facilities, lack of HIV-friendly services in health facilities, and unregulated informal sector in complying with the law.

CONCLUSIONS: The study identified the compliance and non-compliance of the Act to international human rights law standards. It made recommendations to the Government of Uganda, organisations of people living with HIV and AIDS, organisations that advocate for human rights, and national human rights institutions, on the need to eliminate, revise and add some provisions in the Act to create an enabling legal environment that conforms with international human rights law.

PEF1795

UPHOLDING THE RIGHTS OF PEOPLE LIVING WITH HIV IN SUDAN THROUGH PEER SUPPORT: LESSONS FROM THE FIELD

O. Adam[1], A. Hussein[2]
[1]*Sudanese People Living with HIV/AIDS Care Association, Programs and Project Unit, Khartoum, Sudan,* [2]*Sudanese PLHIV Care Association (SPCA), Programs & Project Unit, Khartoum, Sudan*

BACKGROUND: HIV-related stigma and discrimination continues to lead to human rights violations against people living with HIV (PLHIV) in Sudan. In 2015, The Sudanese People living With HIV/AIDS Care Association (SPCA), a member association of over 7,000 PLHIV, documented an increase in the numbers of rights violations against PLHIV in the fields of employment, education, and healthcare. In response, the SPCA launched a project to contribute into the protection and promotion of PLHIV rights in Sudan. Specifically the project aimed to improve PLHIV legal literacy through interactive literacy sessions and free legal system services.

DESCRIPTION: The project implementation took 22 month during 2016-2018, in 9 selected states of Sudan, namely, Khartoum, Gezera, Sinnar, Blue Nile, Kassala, Gadarif, Red Sea, North Kurdufan and South Darfur.

From the start, it was clear that HIV stigma aggressively burdens communal communications on HIV issues.

Peer support intervention used in the project, through recruiting a number of 25-40 active PLHIV peer educators per each state, in counseling and educative communications succeeded in expanding dialogues among PLHIV communities on their rights and how accessing justice. The peer educators in collaboration with the project hired legal advisors conducted a number of 224 formal interactive literacy sessions for the PLHIV members on their rights, through which they reached over 2600 PLHIV member, of them 46% male, 50% female and 4% children.

LESSONS LEARNED: As a result of the program, SPCA documented 104 rights violation cases against PLHIV, of which 62 cases were legally represented and solved. Additionally, according to the project evaluation final report, over 2100 of the participants in the program reported increased knowledge, decreased internalized stigma, and increased access to available legal resources. Our results indicate that peer educators could effectively communicate through barriers of stigma and rejection to assist PLHIV members to stand up and protect their rights.

CONCLUSIONS/NEXT STEPS: For effective project expansion, we recommend the inclusion of peer support in programming to address stigma and uphold the rights of PLHIV in Sudan as a key method of intervention. This is especially important in rural areas where silence surrounds many HIV issues.

PEF1796

ACHIEVING INCLUSIVE HEALTH PRACTICES THROUGH UMUNTHU

R. Kumalire-Phiri[1]
[1]*Art and Global Health Center Africa, Umunthu Program, Zomba, Malawi*

BACKGROUND: The purpose of the Umunthu program is to promote health access as a basic human right of LGBTI people in Malawi. To accomplish this, the program aims to reduce discrimination and build the capacity of civil society and health service providers to support and implement inclusive health policies and practices. With specific regards to HIV, global evidence demonstrates that stigma and discrimination prevent key populations from; seeking and accessing HIV testing, disclosing their HIV status, accessing and practicing prevention, accessing care, and adhering to treatment"

DESCRIPTION: ArtGlo harnesses the power of the arts to nurture creative leadership and to ignite bold conversations and actions. Umunthu program use art as a catalyst for discussion, providing a platform to address contentious human rights issues that have an implication on health. Umunthu is a Pan-African philosophical concept of humanity often defined in a phrase "I am because we are."

The project is being implemented in eight districts across Malawi. It has so far engaged 930 Frontline Health Workers, 310 community leaders, 60 grassroots organizations and 420 Health Worker Students.

LESSONS LEARNED: So far, the midline evaluation has indicated promising positive shifts in attitudes towards LGBTI people amongst frontline health service providers in Malawi. 78% of the trained clinicians are acknowledging the negative implication of discrimination in health service provision and are putting in place strategies to test, treat and manage HIV/AIDS, and promoting health-seeking behavior amongst key population groups and other vulnerable population, that have previously faced discrimination and shied away from accessing services.

CONCLUSIONS/NEXT STEPS: African culture and philosophy are diverse, evolving and subject to interpretation. It is possible to use African belief systems- specifically those focusing on interdependence and tolerance- to promote health-seeking behavior, getting the key population tested, enrolled in ART, ensure adherence and eventually achieve viral suppression. Confrontational approaches can lead to a backlash that entrenches people more firmly in their beliefs. Creative participatory approaches that work with participants' familiar values and ideologies, and facilitate exploration of underlying basis of discrimination, could be an effective way of impacting popular thinking and achieve a positive shift of attitude towards LGBTI people.

PEF1797

THE CONSTRUCTION OF THE SINGULAR THERAPEUTIC PROJECT IN THE RETENTION PROCESS OF PATIENTS LIVING WITH HIV

B.C. Barbosa[1], G. Watanabe[1], A. Magalhães[1], T. Tanaka[1], C.B. Marques[2], M. de Lima[1], M.C. Abbate[3], R.F. de Camargo[3], A. Kalichman[3], M.C. Gianna[3], R. Alencar[3], R. Chuster[3], B. de Jesus[4], A. Grangeiro[1]
[1]University of Sao Paulo, São Paulo, Brazil, [2]SAE DST/AIDS CIDADE LIDER, São Paulo, Brazil, [3]Prefeitura Municipal de São Paulo, Sao Paulo, Brazil, [4]AHF, Sao Paulo, Brazil

BACKGROUND: Demonstrate the importance of the Singular Therapeutic Project (STP) in the process of retaining people living with HIV (PLHIV). The STP is a care organization and systematization device built between health team and patient, considering subject singularities and case complexity.
DESCRIPTION: Intervention research in HIV care services in the city of São Paulo / Brazil, from 2017 to 2022, considering the linkage to care of newly diagnosed cases and retention to antirretroviral treatment (ART). It was observed that the motivations of PLHIV for interruption to treatment are multifactorial and issues such as work, unemployment, shame, difficulties in accepting the diagnosis, social vulnerability, drug abuse, family problems, among others, require articulations that go beyond care centered on medical consultation and / or antiretroviral (ARV) withdrawal. Retention to HIV treatment requires health teams to monitor PLHIV who has vulnerabities that can take them to interrupt their follow up, by providing regular and continuous medical follow-up to ensure clinical follow-up with low bureaucratic demands. However, the singularities of each case must be considered. There were cases of patients treated by the project team who, for successful retention, demanded articulation with specific program networks such as: Social Assistance, Judiciary, Guardianship Council, Basic Health Unit, Family Health Program, once medical scheduling and ARV withdrawal were not sufficient for "good" treatment adherence.
LESSONS LEARNED: Construction of STP involving articulation with care networks and continuous care, enables the approach of the patient to the health service, favoring the construction of joint "goals" for treatment; some cases without STP showed retention failure, contributing to unproductive repetition of appointment scheduling, non-use of ARVs and transmission chain; Qualified listening, on a case-by-case basis, enables better assessment and sharing with health teams and other networks, contributing to the process of retention to HIV treatment.
CONCLUSIONS/NEXT STEPS: The retention to care of PLHIV is directly articulated with the specificity of each case, the guarantee of care and human rights networks.

PEF1798

REMOVING LEGAL BARRIERS TO ACCESSING HIV SERVICES IN NIGERIA: ESTABLISHMENT OF GENDER AND HUMAN RIGHTS STATE RESPONSE TEAM

O. Falola-Anoemuah[1], F. Iyamu-Obi[2], D. Owolabi[3], O. Ndubuisi[4]
[1]National Agency for the Control of AIDS (NACA), Communikty Prevention and Care Services, Abuja, Nigeria, [2]NACA, CPCS, Abuja, Nigeria, [3]UNDP, HIV, Health and Development, Istanbul, Turkey, [4]UNDP, Governance and Peace Building, Abuja, Nigeria

BACKGROUND: The Nigerian HIV prevalence rate is declining, however; stigma indices do not show corresponding decline. The project on the removal of legal and human rights barriers to HIV and AIDS response in Nigeria focuses on strategic investment in human capital resources in the systems that drive policies, quality service provision, facilitate law reforms, law implementation, and legal literacy of stakeholders including key and vulnerable populations with particular focus on popularizing the HIV and AIDS Anti-Discrimination Act (2014) and other relevant laws at the State level.
DESCRIPTION: To drive implementation of the National Plan of Action on the Removal of Legal and Human Rights Barriers to HIV Response in Nigeria (2017-2022), the National Agency for the Control of AIDS (NACA) with the support of UNDP facilitated the capacity building on gender and human rights establishment of State Gender and Human Rights State (GHR) Response. The response team was established in six states comprising legal and paralegal personnel for redressing GBV and other human rights violations targeted at key and vulnerable populations. Results of the engagement were establishment of human rights focal points for reporting and redressing human rights violations and stigma and discrimination cases in the States; developed Plans of Action for GHR Focal Point; established GHRRC WhatsApp platform for easy communication and opportunities between national and state level institutions and partners.
LESSONS LEARNED: The above meeting equipped MDA officers and human rights officers at the national and sub national on the popularization and implementation of the HIV Anti-Discrimination Act (2014). It also strengthened gender and human rights responsiveness of the State HIV/AIDS programme by improving capturing, documenting and reporting data on GHR in the State HIV response especially reporting and redressing stigma and discriminatory practices.
CONCLUSIONS/NEXT STEPS: The consultative meeting agreed on critical next steps to ensure sustainable human rights structure in States thereby expanding access to justice, and promoting human rights of key and vulnerable populations for improved access to HIV services in a coordinated manner in Nigeria. The lesson learned from the operational States will be leveraged to inform the scale up of the structure to other states.

PEF1799

TRANSLATING LAWS PROTECTING PEOPLE LIVING WITH HIV INTO IMPACT: LESSONS AND DIRECTIONS FROM MANILA, PHILIPPINES

A. Adia[1], E. Yoshioka[1], I. Quilantang[2], A. Restar[1], J. Nazareno[1], D. Operario[1]
[1]Brown University School of Public Health, Providence, United States, [2]University of the Philippines, Manila, Philippines

BACKGROUND: Since 1998, the Philippines has enshrined legal rights for people living with HIV (PLHIV) in Republic Act 8504. In early 2019, the Philippine HIV and AIDS Policy Act of 2018 (Republic Act 11166) was signed into law in order to address the rapidly growing HIV epidemic in the Philippines, concentrated among men who have sex with men (MSM). This law contains enhanced legal protections for people living with HIV (PLHIV), yet little research has examined how laws translate into awareness and understanding for key populations to maximize the impact of laws in improving quality of life for PLHIV, including MSM with HIV.
METHODS: We present findings from interviews with 21 HIV-positive MSM Manila, Philippines regarding awareness, understanding, and needs regarding HIV-specific legal protections at the time just before new revisions to the omnibus HIV law were passed.
RESULTS: Overall, there was no standardized way participants became aware of legal protections; few became aware through healthcare providers, while most learned through online resources, social

media, and advocacy organizations. However, even after learning about HIV-specific legal protections, many found the law too complex to understand or did not understand how to use such protections. This led participants to preemptively take action to avoid HIV-related discrimination, even if they were protected by law. Participants demonstrated a strong desire for interventions and policies to improve legal awareness and understanding for PLHIV, government officials, and private businesses.

CONCLUSIONS: This research demonstrates the value of increasing awareness and understanding in policy-specific interventions designed to improve quality of life for PLHIV including MSM with HIV. Interventions centered around legal protections are currently underdeveloped, providing a strong opportunity to integrate such interventions in existing practice or as stand-alone tools to decrease perceived stigmatization. Interventions like plain language materials communicating legal protections as well as legal databases containing successful cases related to discrimination based on HIV status can help maximize social impact for laws protecting PLHIV, including MSM with HIV.

PEF1800

HOW ADOLESCENTS AND YOUNG PEOPLE LIVING WITH HIV ADVOCATED AGAINST ISSUING OF EXPIRED ANTI-RETROVIRAL TREATMENT USING SOCIAL MEDIA

C. Amaiza[1], B. Otieno[1], B. Bakobye[2], J. Kitiabi[3]
[1]Organization of Young People Living With HIV (Y+ Kenya), Management, Nairobi, Kenya, [2]Organization of Young People Living With HIV (Y+ Kenya), Programs, Nairobi, Kenya, [3]Ambassador of Youth and Adolescent Reproductive Health Programme (AYARHEP), Communication and Advocacy, Nairobi, Kenya

BACKGROUND: According to the Kenya AIDs Estimates Report over 184,718 adolescents and young people living with HIV (AYPLHIV) in Kenya require daily antiretroviral medication to live longer healthier lives. This abstract seeks to demonstrate new advocacy strategies used by AYPLHIV in Kenya that ensured Anti-retrovirals being issued at health facilities were of standard and quality as well as how to hold the relevant ministries accountable.

DESCRIPTION: In September 2018 the Organization of Young People Living with HIV (Y+ Kenya) which is the umbrella network of AYPLHIV Organizations shared with AYPLHIV social media pages asking AYPLHIV to check their expiry dates. Responses were collected via all Social Media avenues. Y+ Kenya established that AYPLHIV on Lopinavir are being issued expired medication. Y +Kenya with the support of Youth led organizations asked the arm of the MOH responsible for treatment and care of PLHIV that is National Aids and STI control programme (NASCOP) via a letter to address the issue but this was not taken up. In March 2019 AYPLHIV led by Y+ Kenya took it to twitter and asking NASCOP to address this matter. For 8 working hours AYPLHIV trended on twitter under the #OurLivesMatter. We managed to attract over 123000 impressions.

LESSONS LEARNED: NASCOP reached out to Y+ Kenya who mobilized AYPLHIV for dialogue with seven high ranking officials at NASCOP. AYPLHIV stood their ground agreeing that they want to be at the forefront of getting Virally Suppressed. The officials issued notice to all health care facilities asking them to recheck the expiry of Lopinavir. AYPLHIV were to be changed to available options as recommended in the National treatment and Care Guidelines. The officials commended AYPLHIV for noticing faults in systems and trying to address them. They committed to respond to issues affecting AYPLHIV with urgency.

CONCLUSIONS/NEXT STEPS: It is important to realise that use of social media and its impact can be used to effect change. New technology has enabled the measuring and connection between social media and its tangible change. In future it is important that communities develop accountability mechanisms to ensure governments provide quality commodities and provide treatment literacy information to PLHIV.

PEF1801

CAN YOU HEAR ME? CONNECTING THE UNHEARD VOICES OF YOUNG KEY POPULATIONS IN BANGLADESH

S. Shaikat[1]
[1]SERAC, Dhaka, Bangladesh

BACKGROUND: According to the National AIDS/STDs program in Bangladesh, persons living with HIV are 7500. The risk is sustained due to lack of knowledge about safe sexual behavior among young key populations, social stigma in accessing RH, legal barriers including Article 18 of Bangladesh Constitution prohibits sex work, and Section 377 criminalize same sex relationship, and increasing number of injecting substance abuses together resulting into inclining the risk rate among youth. Policy remain reluctant regarding young key people´s participation at national development process especially regarding their health and rights.

DESCRIPTION: We designed a youth advocacy project to raise the voice of the young key population in the post-2015, and national development agenda. The project titled ´Can You Hear Me?´ organized 8 divisional, and 1 national youth consultations with young people affected by HIV/AID, national advocacy workshops to develop strategic partnerships, and raised inputs and opinions of more than 300 young key people in the country during November-2015 till January-2016.

LESSONS LEARNED: The youths reached ministry of health, international actors including Partners in Population and Development (PPD), and provided inputs at global events including the International Conference on Family Planning, and 12th Inter Ministerial Conference on Population and Development to ensure their voices heard. The consultations under this project were held in all the 8 divisions across the country. Each of that was attended by 20 young key people affected by HIV/AIDS. Participation was ensured from diverse backgrounds as male have sex with male (MSM), Transgender, female sex workers, injecting drug users, persons living with HIV/AIDS (PLHIV), and adolescents.

CONCLUSIONS/NEXT STEPS: The consultation provided a platform for them to express their experiences around sexual and reproductive health and rights, focusing access to services, laws and policies affecting their lives, health and well-being. Given their knowledge and experience on their own societies and state policies, they provided inputs at a Q&A session. Those inputs remark mostly focused their demands on a discrimination free and inclusive society and high level government officials committed to take appropriate actions to remove barriers around access to SRH services for young key population.

PEF1802

INNOVATIONS IN REDUCING HUMAN RIGHTS-RELATED BARRIERS TO HIV SERVICES WITHIN EECA REGIONAL PROJECT

V. Kalyniuk[1,2], M. Sigrist[3], C. Perraut[3]
[1]International Relations Institute of the Taras Shevchenko National University, Kyiv, Ukraine, [2]Alliance for Public Health, Kyiv, Ukraine, [3]Frontline AIDS, Brighton, United Kingdom

BACKGROUND: In most of the post-soviet countries such behaviors as same-sex relationships, sex work and drug use are regarded either criminal or qualify for administrative punishment. Due to high level of stigma in medical and social facilities, and multiple legal barriers in accessing services, the HIV treatment and prevention adherence among key populations is still very low (only 20% of estimated KPs are covered with services).

DESCRIPTION: REAct - developed by Frontline AIDS, is a human rights (HR) monitoring and response system that helps to record and manage cases at the community level. Being online and cloud-stored, it is more secure for those, who use it; system deprives superfluity of papers and simplifies case documenting and solving process.

Within the EECA regional #SoS_project funded by the Global Fund, REAct is implemented by the Alliance for Public Health in 4 countries of the region and serves here as a field for cooperation of service-providing and HR-protecting organizations to ensure prompt and integrated (medical, social and legal) help to the victim, as organizations can refer client and work on the same case in concord. The idea was to coordinate, integrate and optimize efforts in reducing HR violations instead of creating one more documenting system.

LESSONS LEARNED: Online-based way of cases documenting is more secure/faster and integrated.

Cooperation of service and legal organisations is crucial for complex help to victim.

Case documentation has to be community-based but stately-encouraged.

Case documentation is needed as a evidence base for future advocacy.

Case documentation only makes sense if is followed up with concrete advocacy plan.

CONCLUSIONS/NEXT STEPS: REAct is a powerful tool for gathering the evidence needed to advocate for change. A considerable base of hundreds of real cases registered just in a couple of months may serve as a persuasive and powerful argument in dialog with governments to reduce legal barriers and stigma, as changes have to be made systematically on the state legislative level. Using #SoS_project regional platform, Regional Drug Policy Commission and having REAct evidence base, communities can push governments to take measures in facilitating access to HIV prevention and treatment services.

PEF1803

PATIENTS' ACCESSIBILITY ON THE COUNSELING, VIRAL LOAD TESTING, AND TREATMENTS FOR OIS IN ART DECENTRALIZATION SITES IN YANGON REGION

M.M. Htet[1], K.M. Hein[1], K.S. Win[2]
[1]Aye Nyein Metta, Yangon, Myanmar, [2]Asia Catalyst, Yangon, Myanmar

BACKGROUND: Anti Retroviral Therapy (ART) decentralization had been initiated in Myanmar since 2014. In Yangon, the decentralization sites are in urban health centers. The decentralization centers provide consultations, drug dispensing and counseling for the clients.

METHODS: Aye Nyein Metta, a community based organization led by People Living with HIV (PLHIV) conducted community led qualitative study by interviewing 40 patients taking ART from the 4 decentralized sites in the Yangon Region. The interviews were conducted by peer educators from September to November 2019. The questions were designed to understand their experience and difficulties in getting ART and HIV care services in the decentralized sites.

RESULTS: The respondents were between 20-60 years old and the mean age is 39.6 years. They had been transferred to the decentralization sites for 1-3 years.

Counseling

27 (68%) of the respondents did not receive regular counseling in the decentralization sites. The counseling is delivered by the volunteer peer counselors from CBOs or NGOs. Those who undergone counseling sessions reported that they were satisfied with the service.

Viral load testing

26 (65%) of the respondents had the correct knowledge of the viral load testing and aware of their status. However, 8 (20%) of patients did not know that viral load testing should be done every year, and 6 (15%) of patients reported that they underwent blood testing though their results were not discussed.

In some decentralization facilities, on-site blood testing service was not available. Some patients had a burden for the cost to visit National Health Laboratory for the blood collection.

Treatments for OIs and other health problems

The patients got prescriptions for common illnesses, but most of the health problems were referred to the hospitals. The patients had a problem with disclosure of their HIV status in other healthcare settings because they were apprehensive about being stigmatized.

CONCLUSIONS: To achieve the ART scale-up and comprehensive HIV care, the service providers should improve the counseling, viral load monitoring, and treatment for HIV related diseases in the decentralization sites. The patients demand one-site laboratory testing and one-stop services for the treatment of OIs and other diseases.

PEF1804

PROMOTION OF AN ENVIRONMENT FAVORABLE TO PEOPLE LIVING WITH HIV EXAMPLE OF ADVOCACY FOR THE REDUCTION OF STIGMA LINKED TO HIV

S. Lou Bly Bertine[1,2,3], C. Kla[2], T. Niang[2], N. Adingra[2], A. Somian[2], D. Abo[2]
[1]PIGER, Assistante de Direction, Abidjan, Cote D'Ivoire, [2]Femmes Actives de Cote d'Ivoire, Administration, Abidjan, Cote D'Ivoire, [3]PIGER, Direction, Abidjan, Cote D'Ivoire

BACKGROUND: Semi lou Bertine, Christian Kla; NIANG Tiefing ADINGRA Nadia, Alain SOMIAN, Dr ABO.
National Program to fight against AIDS NGOs Active Women Ivorian Network of Organizations of People Living with HIV, Coalition of Women's Organizations Living with HIV in Côte d'Ivoire, Association of Women Legal Experts of Côte d'Ivoire ITPC WA.Context.
In Cote d'Ivoire, the problem of stigmatizing people living with HIV remains a reality. combating all forms of stigma towards these populations and improving their global environment for greater respect for their rights, the network and its affiliated organizations have decided to implement an advocacy program with politicians to reduce the stigma.
DESCRIPTION: Methodology: The program developed consisted of the organization of three months of exchanges on stigma; the installation of 90 departmental monitoring and alert committees. 12 capacity-building workshops on organizational development. carrying out 220 searches for lost sight and 140 sessions on positive health dignity prevention and also to facilitate cases of stigma noted by the members of the watch and alert committee.
This approach consisted in registering PLWHA, key populations and families to benefit from health cover to improve their care.
LESSONS LEARNED: Effective involvement of PLHIV, community leaders in advocacy has enabled us to achieve the expected result.
Facilitation follow-up plans are drawn up and the establishment of a vigil watch committee at the level of each department.
Rights shops are involved with the collaboration of the Ivorian Women .Lawyers Association.
Law n ° 2014-430 OF 14 July 2014 on the prevention, protection and repression regime in the fight against HIV and AIDS adopted by the national assembly for the protection of people living with HIV / AIDS in dimension d 'ivory.
Funding for the creation of income-generating activities for women living with HIV by the first lady.
Some providers who refused to care for PLHIV have agreed to provide care without stigmatizing or discriminating against PLHIV.
CONCLUSIONS/NEXT STEPS: Expanding advocacy committees at the level of other departments in the country, and above all expanding actions towards the community, will help to end the stigma and discrimination linked to HIV by 2030.

PEF1805

"EVEN THE DEVIL WAS GIVEN AUDIENCE BY GOD": DISCOURSE ANALYSIS OF THE RHETORIC AGAINST MEN WHO HAVE SEX WITH MEN IN GHANA

E. Bruce[1], E. Adiibokah[2], S. Thompson[1], D. Komlagah[1], H. Tagoe[2], S. Maher[1]
[1]JSI Research and Training Institute, Inc., Accra, Ghana, [2]Population Council, Accra, Ghana

BACKGROUND: HIV prevalence among men who have sex with men (MSM) is 16 times (18.1%) that of the general male population (1.1%) in Ghana. As such, the National HIV and AIDS Strategic Plan espouses the public health and rights-based approach to mitigate HIV infection among MSMs. The media is a critical medium for information communication and a tool that drives social and behavioral change. This abstract aims to critically analyze media representation of MSM issues and its potential effects on HIV epidemic control among MSMs and the National HIV response.
METHODS: Under the USAID Strengthening the Care Continuum project, implemented by JSI Research & Training Institute, Inc., fifty (50) public and private media pronouncements and publications on MSM were observed and collated over the period December 2016 to November 2019 (37 months) for print and electronic media. Authors conducted a critical analysis of discourse statements for their constitution of power (populist rhetoric for political advantage) and ideology (religious considerations).
RESULTS: The rhetoric around MSM issues was mainly power-based, unscientific and ideologically driven, and aimed at engendering violence, social exclusion, marginalization, stigma and discrimination toward MSM. Most of the discourse emanated from high level political figures and both electronic and print media representation of MSM issues converged and was emotive, negative and misleading. Most (29/50) of the explosive rhetoric around MSM was in the first half of 2016 when there was a new government in place. Only 12 media reportage touched on health, social, reproductive rights or human right issues.
CONCLUSIONS: The negative rhetoric and media representation of MSM issues could have harmful repercussions for HIV epidemic control among MSM and the national HIV response. As a short-term measure, the Ghana AIDS Commission should intensify its sensitization efforts for the executive and legislative arms of the government as well as members of the general public. The Commission should also intensify advocacy efforts to improve the legal environment by removing the antiquated colonial punitive laws against Key Populations from the legal books. MSM-led or friendly CSOs should be strengthened and capacitated to adopt creative approaches to identify, enroll and retain MSMs living with HIV on treatment.

PEF1806

THE LACK A OF THE ACTIVISM AND JUSTICE SERVICES TO DEFEND THE HUMAN RIGHTS AND THE ELIMINATION THE DISCRIMINATION ON THE HEALTH SERVICES FOR THE PEOPLE LIVING WITH HIV

I.I. Lopez Velasquez[1]
[1]Universidad Mariano Galvez, Law, Guatemala, Guatemala

BACKGROUND: At the begging of the HIV epidemic in Guatemala, it was necessary that the people living with HIV complaint the stock-out of ARV, this was possible for the HIV's law that ensure the humans rights of the people living with HIV including the access to ARV.

Currently in Guatemala the PrEp strategy it is not approved and implemented by the health system because it has stock-out of ARV specifically for the therapy of the people living with HIV. The culture of complaint to safeguards their human rights specifically the access of their drugs it is not put in practice by the fear to lose their antiretroviral therapy for free.

DESCRIPTION: This problem affect the target 90-90-90 specifically the second and third 90 because the people living with HIV that are affected by the stock-out are not undetectable. They spent three months without access to ARV.

Women with HIV are affected and only the lack of medication in the last quarter of 2018, the Ministry of Public Health and Social Assistance being responsible for not making the purchase of ARV on time, Guatemala is a country that in the region buys the most expensive antiretroviral drugs and there is no reserve.

Key populations demand new forms of prevention and claiming rights over sexual identity and recognition of sex work but they don't meet the needs of people living with HIV.

LESSONS LEARNED: Women's focus groups in the Petén area denounced they experienced and the fear of being discriminated in the comprehensive care unit , limited the to making a complaint with the Human rights lawyer and this limit to evidence the stock-out that are having the health system.

CONCLUSIONS/NEXT STEPS: 1. Empowerment of people living with HIV should be increased about their human rights.

2. Fostering the culture of reporting and monitoring the comprehensive care they must receive to achieve universal access.

3. Good practices should develop strategies and ensure that the Ministry of Health accepts and commits to ensuring the PrEp.

4. The development of a shopping plan with a reserve of antiretroviral drugs with a minimum of six months.

PEF1807

HIV/AIDS AND INDIGENOUS PEOPLE IN SUB-SAHARAN AFRICA: OPPORTUNITIES AND CHALLENGES

E.E. Njieassam[1], Esther E Njieassam
[1]*University of Johannesburg, Faculty of Law, Johannesburg, South Africa*

BACKGROUND: HIV/AIDS infection is one of the most pressing challenges facing rural women in sub-Sahara Africa. Indigenous peoples in both high and low-income countries are confronted with a heavy burden of diseases including HIV/AIDS. Although much progress has been recorded in the post-industrial world, the impact of HIV/AIDS continue to hit hard on the sustainability of indigenous women in sub-Sahara Africa. Their vulnerability to this virus is as a result of systemic discrimination, racism, stigmatisation, exclusion and structural racism. The impact is severe on women who put their health at risk to attain a certain level of economic and social security.

METHODS: A qualitative method of research will be adopted, including reviewing existing literature on the study from books, journal articles and other reports on HIV/AIDS, prevention and care in sub-Saharan Africa.

RESULTS: Obtaining data on the rate of indigenous women living HIV is difficult, as very few countries have specific data for indigenous peoples. The geographical isolation of their communities shows that they have limited access to mainstream educational, health-care and public health facilities. Low levels of formal education mean that indigenous peoples may find it more difficult to obtain secure work or are frequently employed in lower paid jobs with little access to employer supported health schemes. The study found a scientific explanations of HIV infection and transmission may not be easily reconciled with traditional conceptions of diseases in indigenous communities. It is noted that a relatively small number or no specific policies are in place to address the spread and effects of HIV/AIDS on indigenous women in sub-Saharan Africa.

CONCLUSIONS: The models of HIV prevention and care that have proven successful in non-indigenous communities need significant modifications if they are to be relevant to and successful among indigenous peoples. It is also crucial to impose a specific tax on extractive companies exploiting natural resources on indigenous territories to facilitate the construction of well-equipped health centres to may assist to address HIV cases in these communities.

GENDER EQUITY AND DIVERSITY

PEF1808

PENIS-CENTRIC PRIORITIES: THE INVISIBILITY OF QUEER WOMEN AND FEMALE-BODIED TRANS-DIVERSE PEOPLE IN SEXUAL AND REPRODUCTIVE HEALTH SERVICES

R. Walters[1], A. Solomons[2]
[1]*Positive Vibes Trust, Cape Town, South Africa,* [2]*Positive Vibes Trust, Windhoek, Namibia*

BACKGROUND: *"Bridging The Chasm"*, a SRH-R project implemented by Positive Vibes, through Amplify Change, partners with LGBTIQ and sex-work organisations in five Southern/East African countries to increase quality access to effective, appropriate sexual and reproductive health services for sexual and gender minorities; promote rights-forward approaches to health; and utilise local evidence to influence practice and improve policy engagement. Monitoring, accountability, public participation, active citizenship, democratisation of public health and good governance constitute underlying concepts and activities.

DESCRIPTION: In 2019, LGBTIQ and sex work organisations applied *"Setting The Levels (STL)"* amongst their constituencies in Lusaka, Harare, Francistown, Walvis Bay, Gulu and Mbarara. This participatory methodology for systematic community-led monitoring of health facilities supported diverse populations, communities and healthcare workers from 18 local facilities to review, reflect and dialogue around their distinct perspectives, perceptions and experiences of healthcare, and plan for measurable, accountable improvement.

LESSONS LEARNED: Of several universal themes across five countries, one starkly exposed the intersections between sexuality and gender: that the urgency of SRH-R services prioritises men who have sex with men, and heterosexual, cisgender women. These penis-centric priorities invisibilise lesbian, bisexual and other queer women who have sex with women, and female-bodied trans men, in compound ways that increase their exclusion, vulnerability and marginalisation.

Sociologically, sexuality, safety and pleasure of female-bodied persons are easily dismissed when not functions of associated cisgender, heterosexual male sexual experiences. Queer women and trans men are mysterious – exotic – to healthcare workers who have little understanding of their relationships and can offer little specific information or health education on safety, protection, prevention or risk; or commodities (eg. dental dams; finger cots). Epidemiologi-

cally, queer women and trans men are perceived to be at negligible risk of contracting or transmitting HIV, but little research exists to understand their experiences, behaviours or interactions. Trans men require access to comprehensive sexual and reproductive health, but may not present in settings that are unwelcoming, inhospitable, hostile.

CONCLUSIONS/NEXT STEPS: Effective, rights-forward, equitable policy cannot exist when *"...but not all women"* disclaimers on SRH services apply to populations deemed epidemiologically insignificant. Underserving LBQ women/trans-men is to the detriment of general and HIV-specific health and rights outcomes.

PEF1809

FLEXIBLE AND PARTICIPATING LEADERSHIP DEVELOPMENT PROGRAMS FOR IMPROVING EFFECTIVENESS IN IMPLEMENTING SUCCESSFUL STI, HIV AND TB SERVICE DELIVERY PROGRAMS AMONG TRANSGENDER COMMUNITY MEMBERS IN INDIA

G.K. Pandu Kumar[1]
[1]*Aarambh Foundation, Knowledge Management, Delhi, India*

BACKGROUND: Aarambh Foundaion is a community based organization working on addressing health and human rights issues of Transgender community in northern part of India. Self funded project at Aarambh Foundation, improved its capacity building model to nurture community-leadership in community based organizations for brining improvement in STI, HIV and TB service delivery.

DESCRIPTION: Instead of a narrow focus on HIV, an all-inclusive approach for Transgender was adopted by give emphasis on gender, sexuality, TB, STIs, mental health and legal awareness through an in-house training module. There were training programs for community-ambassadors on overall health and well-being. There were topic-specific modules based on individual interests and areas of work which included outreach and counseling skills . The team members, implementing the STI, HIV and TB intervention were trained on networking, advocacy and sensitization skills.

LESSONS LEARNED: Community ambassadors commenced sessions on general health, sexual health and hormonal treatments during community workshops in the drop in center of Aarambh Foundation. Ambassadors were inspired to pursue further improved courses on addressing human rights of Transgender Community. The team members, implementing the STI, HIV and TB intervention fronted advocacy initiatives with law enforcement, Judicial members and policy makers for sensitization of their work and campaigns.

CONCLUSIONS/NEXT STEPS: Convenient and partaking capacity building modules create platforms for community-based leadership that is empowering the Transgender community members and its also important for improving effectiveness in implementing successful STI, HIV and TB service delivery among Transgender community members.

SEXUAL AND REPRODUCTIVE HEALTH AND RIGHTS

PEF1810

NO RIGHTS, NO HEALTH; PEOPLE BEFORE PATHOLOGY: PUTTING THE "HUMAN" BACK IN "HIV"

R. Walters[1], Z. Ntshuntsha[1]
[1]*Positive Vibes Trust, Cape Town, South Africa*

BACKGROUND: *"Bridging The Chasm"*, a SRH-R project implemented by Positive Vibes, through Amplify Change, partners with LGBTIQ and sex-work organisations in five Southern/East African countries to increase quality access to effective, appropriate sexual and reproductive health services for sexual and gender minorities; promote rights-forward approaches to health; and utilise local evidence to influence practice and improve policy engagement. Monitoring, accountability, public participation, active citizenship, democratisation of public health and good governance constitute underlying concepts and activities.

DESCRIPTION: In 2019, partner organisations applied *"Setting The Levels (STL)"* amongst their constituencies in Lusaka, Harare, Francistown, Walvis Bay, Gulu and Mbarara. This participatory methodology for systematic community-led monitoring of health facilities supported diverse populations, communities and healthcare workers from eighteen facilities to review, reflect and dialogue around their distinct perspectives, perceptions and experiences of healthcare, and plan for measurable, accountable improvement.

LESSONS LEARNED: Immersion across multiple local contexts confirm a core Project belief: that the artificial separation of health systems (perceived as professional; educated; technical; clinical; providers) from community systems (perceived as informal; uneducated; beneficiaries) creates an unnecessary, problematic disconnect between human beings who – being equal under the law, and in fundamental rights and dignity – occupy a shared local system for health, comprised of complex, delicate relationships, interactions and interconnections.

Policy, programme and strategy mirror this dehumanising schism, where "SRH" health priorities are passively isolated, or actively divorced, from "SRR" rights obligations. Where health workers promote and incentivise services to *"find those ones who are hiding, and close the tap on HIV."* Where spaces and language, text and rhetoric pathologise and vilify diverse identities. Where governments court multi-million-dollar contributions in international aid to deliver priority services to populations they publicly disavow, legally disenfranchise and aggressively persecute.

CONCLUSIONS/NEXT STEPS: 2019 project evidence illustrates, compellingly, that amongst sexual and gender minorities, HIV prevention and treatment outcomes through sexual and reproductive health services cannot be effectively realised without sexual and reproductive rights. A rights-forward perspective within the African HIV response is no luxury. Restoring the "human" at the centre of HIV -- and the dignity of personal expression and intimate choice – is an essential component in achieving the end of AIDS.

PEF1811

ACCESSING SEXUAL AND REPRODUCTIVE HEALTH SERVICES FOR WOMEN LIVING WITH HIV IN MYANMAR

H.H. Myint[1], K.S. Win[2]
[1]Myanmar Positive Women Network, Yangon, Myanmar, [2]Asia Catalyst, Yangon, Myanmar

BACKGROUND: Due to 24% new incidences of HIV infections among girls and women in 2015 in Myanmar, National Strategic Plans (NSP) on HIV and AIDS prioritized the accessibility and quality of prevention of mother to child transmission (PMTCT) services. However, WLHIV are still facing significant barriers in accessing sexual and reproductive health (SRH) services due to conservative norms on female sexuality.

METHODS: Myanmar Positive Women's Network (MPWN), a national network of women living with HIV (WLHIV) conducted the community led qualitative study from January to March 2018. Twenty WLHIV from Pathein, Monywa and Magwe Regions were interviewed to document their experience in accessing SRH services including Prevention of Mother to Child Transmission (PMTCT).

RESULTS: Condoms, contraceptive pills and 3-month depo injections were commonly used while Intrauterine device was less accessible because of the higher cost compared to other methods. When receiving the services for contraception, two out of twenty WLHIV did not disclose their HIV status as they thought it is not relevant.

Many interviewees reported extremely limited information of safer pregnancy including availability of antenatal services at hospitals or clinics with trained doctors. Some of them received the prejudice suggestions like 'WLHIV shouldn't have kids' from healthcare providers. The hospital staff pressured one woman to get sterilization because she was HIV positive instead of providing accurate information on PMTCT. Interviewees also reported specific discriminatory behavior from service providers including extra fees for surgery.

Since abortion is illegal in Myanmar, four interviewees undergone unsafe abortion by using harmful practices such as "stepping on the abdomen" and "putting cotton swabs in the uterus."

CONCLUSIONS: Stigma and discrimination are major barriers to accessibility of required SRH services for WLHIV. SRH realization for WLHIV should expand beyond PMTCT and include age specific sexual education, informed decisions on evidence based SRH services, and safe abortion. WLHIV should be included in all aspect of design and implementation stage of SRH policies as well as delivering the services.

PEF1812

HARMFUL ABORTION PRACTICES BY YOUNG SEXWORKERS IN ZIMBABWE

T. Maphosa[1]
[1]CASDI Trust, Harare, Zimbabwe

BACKGROUND: CASDI Trust, a local Zimbabwean non-profit organization is currently implementing an SRH program in Harare and Masvingo provinces with an objective of improving access to relevant SRH information, HIV and SRH services by young people including key population groups such as young sexworkers. Research from the operational area has shown that there is an increased number of young people aged between 14 and 24 seeking post-abortion care services, and increased reported cases of baby dumping especially in Masvingo Province. However, there no evidence in official health records that indicate abortion services being a sought after service.

DESCRIPTION: The program actively engages in school and out of school young people through youth hubs in both rural and urban operational areas where HIV testing and counselling services are provided, as well as contraception services. This is done in partnership with other NGOs that offer specialized SRH services in the community. The youth hubs act as centres where young people gather, socialize and also have access to relevant SRH services. Trainings on community based advocacy are conducted CASDI Trust and key stakeholders such as policy makers actively participate in the program.

LESSONS LEARNED: The table below is a summary of the most popular abortion methods and procedures used by young people aged between 14 - 24, especially those that are actively engaged in sexwork. This data was obtained from the youth hubs:

Abortion Method	Procedure
Euphorbia Tirucalli (Rubber Euphorbia)	The hedge produces a milky substance that is believed to be strong enough to terminate the pregnancy. The fresh part of the hedge is directly inserted into the vagina until bleeding occurs.
Ricinus Communis (Castor Oil Plant)	The leaf of the plant is boiled to produce a concoction that is consumed by the patient. Some of the leaves are directly inserted into the vagina until bleeding occurs.
Coca-Cola Soft Drink and Bicarbonate of Soda	The Coca-Cola soft drink is boiled and then Bicarbonate of soda is added to produce a concoction that is believed to eliminate the pregnancy.
Crochet Hook	The crochet hook is directly inserted into the vagina and the uterus to hook out the developing foetus. Most of those who chose to use this method die from excessive bleeding.
Wire Hanger	The principle is the same as the crochet where a wire hanger is inserted into the vagina and the developing foetus is pulled out. Most of those who chose to use this method die from excessive bleeding.
Family Planning Pills Overdose	An overdose of family planning pills is done, usually 2 or 3 tablets taken per day until bleeding occurs.
Abortion Pills (mifepristone and misoprostol)	Those who can afford to purchase the abortion tablets either from outside Zimbabwe, illegal black market or backdoor dealings with health personnel from registered facilities usually do not follow recommended procedures. Tablets are administered privately in their homes, and some pregnancies will be beyond the recommended period for abortion leading to pregnancy complications or death.

[Table]

There is evidence that young people, especially young sex workers are actively aborting using harmful practices, and that there are many undocumented abortion deaths that have occurred as a result of the illegal nature of abortion in Zimbabwe. Current law in Zimbabwe views abortion as a criminal offence if not authorized by the court of law, leading to such harmful practices.

CONCLUSIONS/NEXT STEPS: CASDI Trust will continue to gather relevant information through its youth hubs, and continue to advocate for policy change on Zimbabwean abortion laws.

PEF1813

EMPOWERMENT OF MARGINALIZED WOMEN IN MYANMAR FOR EVIDENCE BASED SELF-ADVOCACY ON SEXUAL AND REPRODUCTIVE RIGHTS

K.S. Win[1]
[1]*Asia Catalyst, Yangon, Myanmar*

BACKGROUND: Marginalized women including women living with HIV and sex workers face significant challenges in accessing sexual and reproductive health (SRH) services, due to prejudice in traditional values, discrimination and systematic barriers. Community-based organizations (CBOs) play an instrumental role in providing necessary support these women need. However, their ability to advance their advocacy goals is limited. CBOs need support in identifying existing opportunities, enhancing their advocacy skills, and engaging in dialogues for structural reforms.

DESCRIPTION: In 2017, Asia Catalyst conducted a year-long program to strengthen documentation and evidence-based advocacy skills of CBOs. Ten community leaders from four CBOs, including Myanmar Positive Women's Network (MPWN), a national network of women living with HIV(WLHIV), and Right to Health Action Myanmar (RHAM), a sex worker group participated in this project. AC organized a series of capacity building workshops with a participatory peer-to-peer learning approach, centered on community-lived experiences, and local contexts. Subgrants were provided to conduct community led documentation and self-advocacy projects with a focus on SRH rights. AC staff held regular coaching via phone call or face-to-face meeting throughout the entire program.

LESSONS LEARNED: During the program period, MPWN and RHAM interviewed 20 WLHIV and 22 sex workers on the barriers to access to SRH services. MPWN and RHAM developed two policy briefs with policy recommendations, and used these evidence to press for change. MPWN presented the findings in the National Women Forum and was invited to consultation meetings on drafting the SRH policy in 2018-2019. MPWN successfully lobbied draft policy to prioritize issues including safe abortion, accessible and appropriate SRH information and services for marginalize women. At local level, MPWN and RHAM organized meetings with service providers to discuss the issue of discrimination in health care setting in 2018.

CONCLUSIONS/NEXT STEPS: AC believes that with the right mix of knowledge, tools and networks, CBOs can make sustainable changes to protect the rights of their communities. During the democratization in Myanmar, CBOs should seize the opportunities to enhance SRH rights through collective voices and bottom up approach. AC's program seeks to address capacity gaps of community leaders and to promote their meaningful participation pursuing advocacies.

PEF1814

STRATEGIC PARTNERSHIPS FOR OPTIMAL HIV TREATMENT ACCESS

J.W. Mwangi[1], S. Kibet[2]
[1]*AFROCAB, Programming, Nairobi, Kenya,* [2]*AFROCAB, Member, Eldoret, Kenya*

BACKGROUND: Despite significant progress made in the past decade to increase access in HIV care, accelerating availability of new optimal HIV treatment options is major priority for the global HIV community. WLHIV in Sub Sahara Africa have had little or no information on their ART regimens. There is need to accelerate access for patients in low- and middle-income countries to new products that are tolerable, accessible, available and easy to administer.

METHODS: Communities of WLHIV with membership from different countries in Sub Sahara Africa were constituted and included; young mothers. They were to sensitize the community the importance of adherence and the need to have an optimized HIV treatment and its benefits. Several consultations were done in various settings where they engaged with policy makers on accessibility to new optimal ARVs. Advocacy was done with scientific backing with members from all levels, starting from the Ministries of Health, development partners, policy makers to the community in their respective countries.

RESULTS: Under the Academic Model for Prevention and Treatment of HIV and the Kenyatta National Hospital, twenty thousand (20,000) women living with HIV patients who were on 3TC/NVP/TDF are now switched to 3TC/TDF/DTG, including more than five thousand (5,000) newly initiated women. Currently in 80% of facility in Sub Sahara Africa, have experienced less defaulters since many experiencing a lesser pill burden. The general health of many women on Dolutegravir based regimens have greatly improved due to rapid viral suppression.

CONCLUSIONS: Dolutegravir the standard of care drug in many developing countries poised to transform the ARV market in low- and middle-income countries. The community of women living with HIV are a vital link between the global HIV community and the community of people living with HIV. They advocated for optimal HIV treatment, they created demand for optimal products available and drove uptake towards improved quality of life of people living with HIV in low- and middle-income countries thus contributing to the global target to reduce the burden of HIV and AIDS deaths.

PEF1815

THE GAP IN DREAMS PROGRAMMING: AGYW WITH SPECIFIC CONCERNS

B. Cooper[1], B. Roose-Snyder[2], S. Luffy[1], Z. Bulls[2], P. Mitchum[3]
[1]*CHANGE, Policy Research, Washington, United States,* [2]*CHANGE, Public Policy, Washington, United States,* [3]*URGE: Unite for Reproductive & Gender Equity, Policy, Washington, United States*

BACKGROUND: Adolescent girls and young women (AGYW) aged 15-24 in sub-Saharan Africa remain disproportionately affected by HIV, where HIV prevalence among AGYW (3.4%) is more than twice the prevalence of HIV among their male peers (1.6%). AGYW with specific concerns, such as those engaged in sex work, living with disabilities, and those who are part of the LGBTQI+ community, inject drugs, or have been incarcerated, are at even higher risk of HIV and are likely to experience discrimination, violence, and barriers to accessing HIV prevention services.

DREAMS, a $800 million public-private partnership introduced by the President's Emergency Plan for AIDS Relief (PEPFAR), aims to reduce new HIV infections among AGYW by 40 percent in 15 sub-Saharan African countries.

METHODS: From 2016-2019, CHANGE conducted three fact-finding trips to assess the DREAMS programs in South Africa (2016), Kenya (2016), Uganda (2017), Eswatini (2017), and Malawi (2019). CHANGE led semi-structured interviews with U.S. Missions, DREAMS interagency teams, AGYW in DREAMS districts, and approximately 100 civil society organizations that do and do not receive DREAMS funding. Interviews were audio recorded, transcribed, and coded. Country-specific findings were published separately, but this is the first time results have been analyzed across all five countries.

RESULTS: Across countries, CHANGE found that DREAMS programming falls short in providing targeted services for AGYW with specific concerns because they are often not explicitly considered in program design. In some cases, partners reported referring beneficiaries to other programs designed to address their specific needs, such as LINKAGES, PEPFAR's primary program to reduce HIV transmission among key populations including men who have sex with men, transgender persons, sex workers, and people who inject drugs. A Malawian DREAMS partner reported referring beneficiaries to LINKAGES, but LINKAGES only targets AGYW that self-identify as sex workers, trans persons, or persons who inject drugs.

CONCLUSIONS: Across DREAMS country programs CHANGE assessed, AGYW with specific concerns fall in the cracks between the DREAMS and LINKAGES programs. Moving forward, CHANGE recommends that PEPFAR explicitly include AGYW with specific concerns in DREAMS program design and report to Congress on the impact of this work on HIV prevention efforts.

PEF1816

CHALLENGING VIOLENCE AGAINST WOMEN AND GIRLS THROUGH MEDIA INVOLVEMENT

N. Sapphira[1]
[1]*International Community of Women Living with HIV Eastern Africa, Media and Communications, Wakiso, Uganda*

BACKGROUND: Over the past 25 years, significant progress has been made towards eradicating violence against women but much more remains to be done. Women's rights movements, and the implementation and evolution of the international women's human rights framework, resulted in an increased understanding that violence against women is gender-based, a form of discrimination and a violation of human rights. Today, the main challenges are the lack of full protection of women's rights as human rights, coupled with the lack of integrated laws and policies against such violence and the absence of comparative data on different forms of GBV
ICWEALaunchedthe campaign against VAWG

DESCRIPTION: On the 27/11/2019, ICWEA launched a campaign on EVAWG And held several activities that included a press conference to mark the beginning of 16 Days of Activism, with Key Speakers representing Women and Young People Living with HIV, Sex Workers & KPs
event whose road map had begun month back with campaigns running on media outlets in Uganda social media started with a peaceful foot march through the Ugandan capital Kampala. Participants and included; WYLHIV, Sex workers (all gender inclusive), Transgender Men and Women, People with disabilities, culture leaders, religious leaders, police, Government officials.
Six hashtags were created to be used on Facebook and Twitter; #ICWEAStrongTogether, #EnoughIsEnough, #EndVAWG, #PeersMakingItHappen, #Humanisingnotstigmatizing, #We'reNotDone.

LESSONS LEARNED: Problem shared is half solved, ICWEA worked with over 30 journalists, to publicize the campaign. Our hashtag was the most trending.
The involvement of different stakeholders made the event a success. Leaders of every diversity were selected to become champions of ending VAWG.
Increase on Commitment, The Dutch Ambassador "The Dutch government remains committed to ending all forms of violence against women and girls. The Embassy in Kampala will always strengthen partnerships in order to bring to an end this preventable scourge".

CONCLUSIONS/NEXT STEPS: People especially women were given an opportunity, platform, and safe space to disclose their HIV status and encounters of violence.
There is continuous follow up especially with the messages that were shared before, during and after the launch of the 16 Days of Activism.

PEF1817

IMPACTS AND OPPORTUNITIES: BUILDING ALLIANCES IN THE AGE OF GAG RULES

C. Horrigan[1]
[1]*Planned Parenthood Federation of America, Government Relations, Washington DC, United States*

BACKGROUND: The global gag rule is affecting the global fight against HIV/AIDS on an unprecedented scale by directly applying to PEPFAR-funded programs for the first time and a version of it is now in place on the U.S. domestic family planning program. The expansion has widened the scope of the harm caused by the policy, but also created opportunities to forge deeper alliances across HIV, family planning and reproductive health communities and advocates working on both U.S. domestic and foreign policy.

DESCRIPTION: This abstract will provide participants an overview of the global gag rule and its domestic counterpart; detail impacts documented and what they foreshadow if the policies remain; highlight advocacy alliances forged across diverse sectors and partners; and provide examples of innovative policymaker engagement in the effort to end these policies.
The presentation will explore lessons learned and tools from the fight against both the gag rules that could inform advocacy and resilience - and the end of both policies.

LESSONS LEARNED: Research conducted by Planned Parenthood Global through interviews with 22 frontline experts in global health and human rights programs and policy from seven countries revealed key themes, which have been reinforced by additional academic and NGO research:

- The global gag rule weakens civil society.
- The global gag rule disrupts the delivery of a range of health services.
- The global gag rule is halting national policy progress on health and human rights.

In the 3+ years following the expansion of the global gag rule, advocates across a range of sectors have leveraged these findings in innovative advocacy to increase awareness of the policy and broaden the set of stakeholders, including policymakers, with a record number of diverse organizations and policymakers calling for an end to the policy.

CONCLUSIONS/NEXT STEPS: This presentation will provide new insight into the impact of gag policies on HIV/AIDS programs and engage participants in a discussion about the successes and need for more collaboration across HIV, family planning and reproductive health programs and advocacy to end the global gag rule. The presentation will explore how to sustain these alliances after the immediate crisis of the gag rule is lifted.

CHILDREN'S RIGHTS AND HIV

PEF1818

THE NATIONAL YOUNG PEOPLE'S PLANNING FORUM (NYPPF) EXPERIENCE: DEVELOPING THE PHILIPPINE OPERATIONAL PLAN TO ADDRESS HIV/AIDS THROUGH CAPACITY BUILDING AND EMPOWERMENT OF CHILDREN AND ADOLESCENTS

R.A. Villafranca[1], M.M. Uy[2]
[1]Council for the Welfare of Children, Policy and Planning Division, Quezon City, Philippines, [2]Council for the Welfare of Children, Quezon City, Philippines

BACKGROUND:
There is a need to strengthen mechanisms to enable incorporation and consideration of inputs of children and adolescents as primary recipients of policies and plans which are being developed for them. Since the Philippine government has recently enacted its comprehensive HIV/AIDS law which is currently being complemented by a plan of action to achieve the 90-90-90 target, the Committee on Children and HIV/AIDS of the Philippine government's Council for the Welfare of Children issued a catalyzing resolution which led to the involvement of children and adolescents in the finalization of said documents.

DESCRIPTION:
The National Young People's Planning Forum was the conclusion of a series of engagements with the public, private, and youth sector to form the operational plan of the Philippine HIV Medium-Term Strategic Framework. It was conducted on December 2018 in Manila and gathered around 200 adolescents from 17 Philippine geographical regions. The program was led by *animators* who were adolescents and who were trained on both child rights and HIV tenets. During the NYPPF, the adolescents were provided a platform to prioritize strategic directions and to recommend the activities which shall be in place to implement the targets.

LESSONS LEARNED: It was amplified through the NYPPF that child and adolescent participation is feasible in HIV policy programming. The participants highlighted the need to strengthen the social service and child protection perspective in addressing HIV as it affects the youth to veer away from the *reactive* health service delivery. Furthermore, the participants emphasized the need to establish a prevention framework for YKP based on their experiences.

CONCLUSIONS/NEXT STEPS: The conduct of the NYPPF served as a good practice of child participation as it peaked on allowing children to develop frameworks for consideration by the duty bearers. Ideally, once implemented, the adolescents should acquire *ownership* on the plans that they developed thus leading to their further participation on the implementation of the plan. The results of the NYPPF will also be presented to the CWC Board as the highest policy making body of the Philippine government on children for consideration in the development of further policies and guidelines as established evidences by young people.

REPRESENTATIONS OF STIGMA: SOCIAL ATTITUDES, MEDIA AND PUBLIC DEBATE

PEF1819

PUBLIC COMMUNICATION ON TWITTER ALSO EXPRESSES A BACKLASH IN THE BRAZILIAN RESPONSE TO AIDS

D. Barbosa[1], I. França-Junior[2], V. Silvia Facciolla Paiva[3]
[1]Universidade Federal de Rondonópolis, Political and Applied Sciences, Rondonópolis, Brazil, [2]Universidade de São Paulo, Public Health, São Paulo, Brazil, [3]Universidade de São Paulo, Psychology Institute, São Paulo, Brazil

BACKGROUND: Brazilian HIV/AIDS prevention and treatment initiatives have used social media. Twitter is an important civic engagement tool and Brazilian Ministry of Health (BMH) keeps using Twitter for HIV/AIDS communication (HAC) after the extinction of the HIV/AIDS department in mid-2019. We aimed to characterize changes in Brazilian public HAC on Twitter.

METHODS: We used a mixed method approach including text mining, Bitterm Topic Modeling for Short Text and data annotation. Two major communication periods were identified: from early 2011 to mid-2019 and from mid-2019 onward. In the first, HAC was posted by the HIV/AIDS department. In the second period, HAC has been posted only by the main BMH Twitter account. We analyzed 6.419 (1st) and 3.238 (2nd) tweets. The number of topics to be modelled was specified by the highest log-likelihood criteria, yielding 42 (1st), and 37 (2nd).

RESULTS: For the first period, the annotation process indicated as meaningful topics condom use (n=14), HIV testing (n=7), pre-exposure prophylaxis (n=2), post-exposure prophylaxis (n=1) and stigma (n=1). Of these, the majority (n=17) included the words "HIV" or "AIDS". Seven topics contained behavior change words, like "use". In the second period just one topic was HIV related, characterized by the words "condom" and "sexually transmitted infections". The deactivation of the HIV/AIDS Program HAC account shows a political and institutional backlash, and changed the quantity and content of HAC by the BMH. Considering both periods, no topic indicated words pointing to vulnerable groups and scarce mentions on topics on social vulnerability such as stigma. The previous communication, unbalanced towards condom use and HIV testing, was replaced by one restricted to condom use with a general STI appeal, suggesting that new HAC might foster HIV/AIDS unawareness. Finally, our analysis indicates that most HAC aimed behavior change and to inform about HIV/AIDS themes, neglecting beliefs, attitudes, culture or broader social context.

CONCLUSIONS: These findings highlight the challenges of theory and practice in HIV/AIDS communication. Our approach can nurture future studies aiming to identify health communication changes followed by drastic shifts in sociopolitical contexts.

IMPLICATIONS AND BACKLASH TO THE GROUPING OF AND LABEL OF "KEY POPULATIONS" ON REACHING HIV RESPONSE TARGETS

PEF1820

DIFFERENTIATION IN DIFFICULT ENVIRONMENTS: OFFERING CLIENT-CENTERED OUTREACH STRATEGIES TO SUPPORT MEN WHO HAVE SEX WITH MEN TO KNOW THEIR HIV STATUS IN JAKARTA, INDONESIA

C. Francis[1], E. Rista Aditya[1], L. Permana[1], M. Setyawan[1], A. Kustiawan[1]
[1]*FHI 360, Indonesia, Jakarta, Indonesia*

BACKGROUND: Differentiated outreach service delivery approaches that assist men who have sex with men (MSM) to learn their HIV status are critical in programmatic contexts where key population behaviors are stigmatized or criminalized, and community- and self-based HIV testing modalities are not fully actualized. Offering a variety of iterative outreach entry points that meet the differentiated preferences of this heterogenous population can provide effective, efficient, and protective ways to reduce the impact of HIV on individuals and help national programs move toward epidemic control in complex programmatic environments.

DESCRIPTION: The LINKAGES project, supported by USAID and PEPFAR, has activated nine discrete outreach streams in Jakarta, Indonesia, to assist MSM to learn their HIV status. Four face-to-face outreach approaches capitalize on paid community-based supporters or volunteer peer mobilizers to promote HIV testing behaviors. Five online outreach strategies utilize online outreach workers, social influencers, targeted advertisements, campaign messaging, and dedicated chatbots to direct MSM and other at-risk men to an online platform in which they can self-assess their risk behaviors and make appointments for HIV testing at key-population-friendly clinics.

LESSONS LEARNED: From July 2018 to September 2019, 23,826 self-identified MSM availed testing services, with 2,956 identified as HIV positive. Average quarterly case-finding rates increased by 17% following activation of all outreach streams. These case-finding efforts identified 95% of total MSM diagnosed with HIV in Jakarta over the 14-month period.

CONCLUSIONS/NEXT STEPS: Ending the AIDS epidemic in Indonesia is unthinkable if people who are at high risk of HIV infection are not getting services in ways that meet their needs in order to stay healthy. Providing a variety of testing entry points can help to expand HIV programmatic coverage among a city's most vulnerable residents, even in disabling programmatic contexts.

EXPERIENCES AND IMPACTS OF HOMOPHOBIA AND TRANSPHOBIA

PEF1821

ENABLING POLICY DEVELOPMENT TO CREATE A FRIENDLY WORKPLACE ENVIRONMENT FOR VULNERABLE MSM AND TRANS INDIVIDUALS IN CORPORATE AND EDUCATIONAL INSTITUTIONS

T. Chopade[1], S. S[1], V. Anand[1], A. Siroya[1]
[1]*The Humsafar Trust, Advocacy Unit, Mumbai, India*

BACKGROUND: While consensual same-sex sexual acts have been decriminalized in India, there are limited laws/policies that protect discrimination of MSM and Trans communities in workplaces and educational institutions. Humsafar Studies show that 65% of Trans Individuals drop out of school due to bullying and harassment and subsequently are less motivated to engage in stable employment as they fear continued discrimination and harassment. Lack of MSM and Trans friendly workplace policies results in low self-esteem, fear, heightened exposure to bullying, harassment, poor performance at work and lack of job security. Hostile attitudes towards MSM/Trans communities also contribute to employment inequality, marginalization and socio-economic alienation for MSM/Trans at workplaces and educational institutions.

DESCRIPTION: The Humsafar Trust is a Community Based Organisation (CBO) working in 27 states of India which focuses on capacity building and sensitization of key policymakers and stakeholders. The advocacy initiative undertakes capacity building of corporates and educational institutions to have non-discriminatory policies, community support groups to address issues of violence and harassment faced by MSM and Trans individuals. Different methodologies including discussions, presentations and staging MSM/trans themed plays are used to engage corporates and educational spaces for MSM/Trans friendly policy development and innovative initiatives to create safe spaces for MSM/Trans communities.

LESSONS LEARNED: There is limited social awareness of MSM and Trans communities which often leads to stigma and discrimination of these individuals. In the absence of MSM/Trans friendly policies, violence/assault, redressal cells, individuals hesitate to report these experiences. Legal recourse is limited as well as current laws governing assault and harassment are not gender-neutral and/or do not recognize MSM and Trans individuals.

CONCLUSIONS/NEXT STEPS: Advocacy and sensitization have helped 38 corporates and educational institutions to develop all-inclusive policies and the formation of support networks to enable friendly workplace environments for MSM and Trans communities. It is important to continue advocacy efforts in these spaces that will strengthen community voices and enable them to express their sexuality and enhance their productivity. Making workplaces more inclusive, improved mental health and creation of job opportunities for Trans communities that will reduce their vulnerability to HIV and AIDS and gain more social acceptance.

PEF1822

CRIMINALIZATION OF LGBTIPHOBIC DISCRIMINATION AND VIOLENCE IN BRAZIL: A STEP TOWARDS REDUCING VULNERABILITIES

A.L. Martins Harrad Reis[1]
[1]*Grupo Dignidade, Curitiba, Brazil*

BACKGROUND: LGBTIphobic violence and discrimination are rife in Brazil. Official statistics are incomplete, but shadow NGO monitoring points to over 300 LGBTI persons being murdered every year in Brazil for LGBTIphobic reasons. There is no specific federal legislation to protect LGBTI people.

DESCRIPTION: In 2012 and 2013, two lawsuits were filed at the Supreme Court, one requiring recognition of the National Congress' obligation to legislate to criminalize this form of discrimination and violence, and the other to recognize National Congress omission in not legislating thus far on this matter and require that LGBTIphobic violence and discrimination should be criminalized in the same way as racism already is. Our organization and other partner organizations were admitted to the proceedings as amici curiae and attended and spoke at Court hearings, provided written briefs and met with Supreme Court judges and other key stakeholders between 2012 and 2019, advocating for a ruling in favor of the two lawsuits which were judged as one single case as they referred to the same issue.

LESSONS LEARNED: The Supreme Court has eleven judges and we were able to present our case individually to the majority of them in the period prior to judgment, arguing in favor of criminalization and providing legal and other information to support our claim. On June 13th 2019 the Supreme Court completed its judgment of the case and ruled that until such time as the National Congress legislates on the matter, LGBTIphobic crimes shall be punished by the Judiciary in the same way as crimes of racism.

CONCLUSIONS/NEXT STEPS: This case showed the fundamental importance of civil society advocacy efforts in helping to redress social inequalities and vulnerabilities involving key populations affected by the HIV epidemic, providing an example to countries that still criminalize same sex relations, by criminalizing LGBTIphobic actions instead, thus reducing stigma and barriers to health services and promoting awareness and respect. Next steps include advocacy actions in the National Congress for a law that protects LGBTI people as well as local advocacy and social watchdog actions to ensure that the Supreme Court ruling is enforced throughout the country.

HUMAN RIGHTS PROGRAMMES

PEF1823

ADVOCACY FOR THE HUMAN RIGHTS OF KEY POPULATIONS, A VECTOR OF SOCIAL AND LEGAL TRANSFORMATION: A LOOK BACK ON AN AFRICAN-CARIBBEAN-FRENCH INTER-ASSOCIATIVE PARTNERSHIP

P. Bignon[1], E. Poultreniez[1], V. Some[2], C. Anoma[3], F. Mananga[4], A. Martin[5], A. Toullier[1]
[1]*AIDES, Seine Saint-Denis, Pantin, France,* [2]*REVS PLUS, Bobo-Dioulasso, Burkina Faso,* [3]*Espace Confiance, Abidjan, Cote D'Ivoire,* [4]*Alternatives Cameroun, Douala, Cameroon,* [5]*COIN, Santo Domingo, Dominican Republic*

BACKGROUND: Human rights (HR) violations of key populations (KPs) are hampering the global fight against the HIV epidemic. From 2014 to 2018, AIDES and 7 African and Caribbean associations developed a HR project of advocacy in favor of KPs' human rights, thought and carried out by local community-based organizations (CBOs), to promote social and legal transformation.

DESCRIPTION: The same method was followed in each CBO: 1) Reinforcement of advocacy capacities, with creation of one advocacy manager position per association; 2) Use of advocacy activities to raise awareness, mobilize allies and intermediary bodies; 3) Involvement of KPs to support the advocacy.

LESSONS LEARNED: 1. REVS PLUS (Burkina Faso) has transformed the national paradigm on drug policies. An International advocacy, a communication campaign and an ongoing dialogue with public authorities have led REVS PLUS to be responsible for coordinating the national drug strategy. 2. Alternatives Cameroon succeeded, by representing KPs within the Country Coordinating Mechanism of the global fund (CCM), to improve access to health for transgender people in the National Strategic Plan (NSP) on HIV. 3. Espace Confiance (Ivory Coast) produced an alternative report when the country was reviewed within the Universal Periodic Review. One of its recommendations was included: the abolition of the crime of "public indecency", used to discriminate against MSM. 4. COIN (Dominican Republic) was able, by coordinating the institutional commission on drug policy, to convince the Ministry of Health to train its caregivers in harm reduction and obtained the launch by UNODC of a study on the limits of the current legislation on drugs. 5. ANSS (Burundi) advocated towards the members of the CCM so that the PWUDs were taken into account in the NSP.

CONCLUSIONS/NEXT STEPS: Despite the project having ended, involved CBOs followed-up, each according to their own realities. This experience shows that advocacy in favor of KP's human rights contributes to empower KP, to mobilize their allies and to improve public policies, even in repressive contexts, and thus improve their legal environment. Funding for HR advocacy must therefore continue to be a major focus in the global fight against HIV.

LEGAL ADVOCACY TOOLS AND STRATEGIES

PEF1824

PROMOTING AN ENABLING ENVIRONMENT FOR AN EFFECTIVE HIV RESPONSE AMONG KEY POPULATIONS THROUGH COMMUNITY-BASED LEGAL AID SERVICES AND LEGAL LITERACY IN MYANMAR

H.H. Yu[1], M.K. Lwin[2]
[1]Sex Worker Network in Myanmar (Taw Win Kha Yay Network in Myanmar), Yangon, Myanmar, [2]UNAIDS, Yangon, Myanmar

BACKGROUND: Although the protection of human rights is one of the guiding principles of Myanmar National Strategic Plan on HIV, repressive laws and policies fuel stigma and discrimination against key populations (KP) hampering their access to HIV services

DESCRIPTION: A community-based legal aid program has been established by the Sex Worker Network in Myanmar (SWiM) to promote access to justice and legal literacy for KP while ensuring continuity of ART during the trial period, in Yangon. Between July 2018 and September 2019, SWIM received several cases through its hotline, analyzed them with the support of UNAIDS and selected the ten most vulnerable -4 relating to sex workers (SW), 4 to people who use drugs (PWUD) and 2 to people who have sex with men (MSM). Two lawyers provided legal aid services to these KP who were unjustly arrested throughout the trial period. In addition, trainings on Human Rights and legal literacy were conducted by Lawyers for 106 KP in three regions.

LESSONS LEARNED: Three out of the ten cases (2 MSM and 1 PWUD) were cleared of all allegations made against them while 3 PWUD were sentenced to five years of imprisonment and 4 SW to one year of imprisonment. In the latter case, SW were convinced by police to confess that they were SW which is subject to a penalty of up to one year in prison. As SW are often the sole breadwinner of the family, they may opt for the confession rather than spending time preparing for trial. Doing so, they however take more risk to be arrested and face potentially longer prison sentences as they are registered as SW in police record. This lesson was included in the basic human rights and legal literacy training to help SW carefully consider their options before making a decision

CONCLUSIONS/NEXT STEPS: Lessons learned from this program have been used in advocacy with relevant stakeholders to endorse the new draft law that decriminalizes sex workers. Such community-based legal aid services and legal literacy programs need to be scaled- up to foster an enabling environment for KP- a prerequisite for fast-tracking the HIV response in Myanmar

PEF1825

POLICE ADVOCACY FOR MSM AND TGH COMMUNITY: SENSITIZING THE LEGAL ENFORCEMENT AGENCIES ABOUT THE ISSUES AND RIGHTS OF LGBTQ COMMUNITY THROUGH ADVOCACY

V. Patil[1], M. Sivasubramanian[2], T. Chopade[1], S. Shwetambera[3], V.R. Anand[3]
[1]The Humsafar Trust, Advocacy, Mumbai, India, [2]The Humsafar Trust, Capacity Building, Mumbai, India, [3]The Humsafar Trust, Mumbai, India

BACKGROUND: In 2001, for the first time we came across the instance of police officials obstructing outreach work conducted by Targeted Intervention staff of The Humsafar Trust, who were creating awareness among MSM/TGH about HIV & STI and use of condoms. To address this issue we started advocacy with law enforcement agencies on dispelling myths and misunderstandings around HIV/STIs and condom usage. This further included conversation son social discrimination, crisis(extortion, bullying and blackmailing) faced by MSM/TGH, discrimination in education and workplaces against the LGBTQ community on account of their sexuality and gender expression and adverse legal environment caused due to Section 377, that until 2018 criminalized consensual homosexual sex.

DESCRIPTION: We started advocacy in co-ordination with Mumbai District AIDS Control Society. On 110 outreach sites, we analyzed the areas and marked the nearby police stations for conducting awareness programmes. We visited each police station and discussed the issues faced by the community. We informed the police about HIV/AIDS and STI, rights and issues faced by MSM and TGH community pertaining to health and crisis. For this sensitization we used IEC materials, penis models and Condoms provided under government program. Till date we have reached out to over 5000 police at total 110 sites and raised awareness about the issues and discrimination faced by the MSM and TGH community.

LESSONS LEARNED: We have learnt that it is possible to work with the police and develop them as an ally in HIV/AIDS Targeted Intervention program. At present the police on these sites co-ordinates with us on crisis cases faced by the MSM and TGH community and helps through the legal procedures. An improved rapport with the police department has made the process of getting permission from police for other LGBTQ rights based events much easier over the years.

CONCLUSIONS/NEXT STEPS: These efforts helped us in making HIV/AIDS intervention program on the ground fear free. It also enabled mainstreaming issues of MSM and TGH. Our future goal is to effectively reach more such people in police, army and politicians and to engage in a healthy discussion through such sensitization drives for effective outcomes.

PEF1826

ARTICULATING TRANSNATIONAL MOBILIZATION AND NATIONAL LAWMAKING: LESSONS FROM THE ADVOCACY FOR THE WORLD HEALTH ASSEMBLY TRANSPARENCY RESOLUTION IN FRANCE

I. Alaoui[1], C. Izambert[1], T. Brigand[2], B. Petit[3], A. Toullier[1]
[1]AIDES, Pantin, France, [2]Doctors of the World/Médecins du Monde, Paris, France, [3]Global Health Advocates/Action Santé Mondiale, Paris, France

BACKGROUND: The transparency resolution for health products proposed by Italy during the 2019 World Health Assembly (WHA) generated considerable opposition from some high-income countries. In the context of opaque price-setting negotiations and strong intellectual property rights, securing the adoption of the resolution was particularly challenging for civil society and required targeted advocacy among governments along with organizing citizen mobilization worldwide.

In France, using these techniques enabled organizations to push the government towards more transparency and improved access to HIV/AIDS therapeutic innovations.

DESCRIPTION: In line with WHA and French parliamentary agendas, advocacy strategies were deployed from February to December 2019. Along with other organizations, Doctors of the World, Global Health Advocates and AIDES' information and advocacy campaigns first targeted the Ministry of Health, which did not release any official

position. Therefore, lobbying was shifted towards parliamentarians, informing them on the resolution and submitting oral questions to the government.
This lobbying campaign was backed by international alliances, grassroots mobilization (online demonstrations), and direct questioning of the government in social networks and the press. Pressure was put on French decision-makers, ultimately leading to a clear positioning of France in favor of the resolution.
Following this resolution, during the drafting of the 2020 Social Security Financing Bill for September, civil society led a new campaign to make sure the government's commitments were followed by actions. In December, the parliament adopted with a large cross-partisan majority a key amendment stating pharmaceutical firms will have to publish the amount of public subsidies received for the development of treatments.
LESSONS LEARNED: Multiscale advocacy and campaigns compelled France to take a symbolic public stand in favor of the transparency resolution on the day of the vote. By redeploying similar strategies nationally, civil society led decision-makers to adopt legally-binding transparency measures.
CONCLUSIONS/NEXT STEPS: This campaign created a cross-partisan consensus in favor of more transparency in price-setting negotiations. Unfortunately, the measure adopted by the parliament was censored by the constitutional council for procedural reasons. Next step will thus be to advocate for a re-adoption of the measure, the drafting of new transparency propositions, and towards an effective enactment of the transparency resolution by regulatory authorities.

PEF1827

OPPOSITION AGAINST THE PATENT COVERING TISAGENLECLEUCEL, LESSONS FROM HIV TO ADDRESS MONOPOLY ABUSES IN CANCER

T. Brigand[1], P. Durisch[2], J. Offe[3], R. De Ridder[4], O. Maguet[1]
[1]Médecins du Monde France, Paris, France, [2]Public Eye, Lausanne, Switzerland, [3]Arzte der Welt, Munich, Germany, [4]Médecins du Monde Belgique, Brussels, Belgium

BACKGROUND: With the introduction of antiretroviral (ARV) treatment against HIV in the 1990s, it became clear that exorbitant prices of medicines permitted by patents and associated monopolies - were limiting access to life-saving treatment in low- and middle income countries. Advocacy and legal measures by governments and civil society against these monopolies led to the possibility of generic production ARV which was followed by a sharp reduction in prices. In the 2010's, similar difficulties appeared even in the world's richest countries with hepatitis C treatment at prices that forced health systems to organize rationing.
Today, new cancer treatments are marketed at exorbitant prices. CAR-T therapies cost up to $475,000 per patient (€280.000 Euro in Europe). These prices present a major challenge for access to cancer therapies as well as the sustainability of health systems. To defend the right to health, Medecins du Monde and Public Eye built on advocacy tools originally developed in the fight against AIDS and hepatitis, including patent oppositions.
DESCRIPTION: Patents are granted based on three criteria: novelty, inventive step and industrial application. A patent opposition is a legal procedure for challenging the validity of a granted patent. After the proceeding, the patent may be maintained, amended or revoked. When revoked, the legal effects associated with the patent are suspended, including monopoly rights. Patent oppositions therefore make it possible to act against unmerited monopolies.
In July 2019, both NGOs filed an opposition at the European Patent Office (EPO) against a patent covering Tisagenlecleucel, a cell therapy against cancer, arguing that it lacks an inventive step.
LESSONS LEARNED: November 2019, Novartis and the University of Pennsylvania requested revocation of the opposed patent.
Other patents are in force so that it is still not possible to produce cheaper biosimilar versions. However, the revocation demonstrates monopoly abuses on new cancer treatments. By weakening intellectual property, this opposition makes it easier for government to negotiate fairer prices.
CONCLUSIONS/NEXT STEPS: This initiative demonstrates the benefit of using advocacy strategies developed for HIV in the cancer fight. The input will discuss convergences and differences in political strategies in access to affordable medicines around HIV and cancer.

PEF1828

ATTB/HIV – ADVOCAY TB/HIV TREATMENT BRAZIL

J.C.V.P. Silva[1], C.P. Almeida[1]
[1]Rede Brasileira de Pesquisas em Tuberculose REDE-TB, Social Mobilization, Rio de Janeiro, Brazil

BACKGROUND: Although there are recommendations for preventive treatment of tuberculosis in children exposed to TB and people living with HIV / AIDS, there is no short-term preventive treatment policy in the country (01 dose per week for 12 weeks)
DESCRIPTION: The project, in partnership with the TAG (Treatment Action Group), developed advocacy actions with HIV / AIDS social organizations and the national parliamentary committee against tuberculosis to promote the discussion of including 3HP preventive treatment (rifapentin and isoniazid) for children. exposed to TB and people living with HIV / AIDS. Meetings were held between government, civil society and parliamentarians. A strategy of opposition to 3HP's intellectual property registration in the country was also established.
LESSONS LEARNED: Most social and parliamentary organizations were unaware of the possibility of short-term treatment with 3HP (Rifapentina and Isoniazida), advocacy actions were carried out to contribute to the construction of a public policy for access to preventive treatment of short-term TB. 3HP for people living with HIV / AIDS. The National Commission of Parliamentarians against TB has set an agenda for public hearings on the theme for 2020 with the participation of civil society, researchers, government representatives and parliamentarians.
CONCLUSIONS/NEXT STEPS: Promote strategic action in the Federal Parliament in March 2020 to raise awareness among parliamentarians of the importance of access to preventive short-term tuberculosis (3HP) treatment for people living with HIV / AIDS and children exposed to TB bacilli. Focus the theme on all national HIV / AIDS events with the objective and clarify the importance of access to 3HP for people living with HIV / AIDS, promote the construction of an information network on TB preventive treatment for people living with HIV / AIDS. AIDS

PEF1829

"NOTHING ABOUT US WITHOUT US": LEGAL ACTIONS AGAINST THE PENALIZATION OF CLIENTS BY SEX WORKERS AND COMMUNITY-BASED ORGANIZATIONS IN FRANCE

C. Devaux[1], C. Lespérance[2], A. Baudry[3], M. Henriquet[4], J. Sarrazin[5], J.-R. Ploton[6], S. Durocher[7], M. Vicart[8], F. Thune[9], A. Toullier[2], I. Aboudaram[10], C. Le Gouëz[2], S.-M. Maffesoli[10]
[1]Fédération Parapluie Rouge, Marseille, France, [2]AIDES, Lyon, France, [3]Cabiria, Lyon, France, [4]Paloma, Nantes, France, [5]Grisélidis, Toulouse, France, [6]Autres Regards, Marseille, France, [7]Planning Familial, Paris, France, [8]ARCAT, Paris, France, [9]Sidaction, Paris, France, [10]Médecins du Monde, Paris, France

BACKGROUND: In France, if sex work is legal, the conditions under which this activity is carried out are illegal. Furthermore the penalization of clients was established by the law in April 2016. This legal framework contravenes the objectives of public health and access to rights: it increases vulnerabilities and violence against sex workers (SW), has a negative impact on SW's health and rights as well as it makes more difficult for them to negotiate safe-sex practices. To challenge this harmful legal framework, community-based organizations decided to engage in legal actions.
DESCRIPTION: Legal advocacy took place in two stages:
1) the referral to the French Constitutional Council (CC) by thirty sex workers and supported by 22 non-governmental organizations (NGO) in order to invalidate the penalization of clients under the Prostitution Law. On February 1, 2019, the CC issued its decision. While it recognized that sex work could be carried out freely, it relied on the principle of human dignity to defend the penalization of clients.
2) Following this decision, 254 sex workers working in France decided to bring their case to the European Court of Human Rights.
LESSONS LEARNED: The CC issued a rather negative decision and the legal outcome of the referral to the ECHR is uncertain, but these legal actions also have positive repercussions: mainstreaming of SW's political demands in the media outlets, public awareness of the failures of the law, strengthening alliances. The referral to the ECHR represents an opportunity to create new alliances, expand the social and geographic basis of criticism of repressive laws and strengthen advocacy at European level. This is a strong issue because France and Sweden make abolitionism an axis of their European diplomacy.
CONCLUSIONS/NEXT STEPS: Legal actions by sex workers remind us that public policies relating to sex work cannot be developed without them: by engaging into legal actions, they mobilize their communities and bring back the persons most affected by these laws, the sex workers themselves, at the center of the debate, thus exposing the concrete and harsh consequences of decisions issued without taking into account their health and human rights.

PEF1830

LOOPED IN: A UNIQUE ONLINE TOOL TO EMPOWER AND ENABLE SELF-ADVOCACY FOR PEOPLE LIVING WITH HIV IN THE UK

D. Gold[1], S. O'Neill[1], K. Smithson[1], K. Hay[2]
[1]NAT (National AIDS Trust), London, United Kingdom, [2]Northumbria University, Newcastle, United Kingdom

BACKGROUND: Around 103,800 people live with HIV in the UK. For most, HIV is a manageable long-term condition. However, HIV stigma contributes to suboptimal experiences – in 2017, 14% reported discrimination in health services that year. People living with HIV are powerful human rights advocates in all settings, but this can lead to 'educator's fatigue'.
DESCRIPTION: Looped in is an interactive online tool allowing people living with HIV to curate information for target recipients in a variety of formats. The information is written by NAT (National AIDS Trust), the UK's HIV policy & campaigns charity. We harnessed NAT's unique expertise in HIV to create individualised, shareable information pages about people's rights on treatment, privacy and employment. The tool aims to empower people living with HIV to realise their rights by aiding interpersonal communication.
NAT designed Looped in through collaboration with a digital partner, and extensive participatory engagements across the UK. This included a design sprint, an initial interview study, a focus group to evaluate prototypes and use scenarios, sustained conversations with potential users about content, and a community launch event. We applied a participatory approach to all worksteams. Since launch we have collected and analysed website data and sought community input to better inform developments and applications of the tool.
LESSONS LEARNED: Qualitative inquiry suggests Looped in has provided a unique and meaningful service to people living with HIV in the UK. One user and support service manager in the south of England said, "Absolutely love, love, love this website [...] Gonna use it as a tool for newbies or ... anyone who hits that part of their rollercoaster ride which may be just all too much". Looped in maintains hundreds of unique users in the UK within a specialised audience, with work ongoing to extend the tool's visibility in clinical, community and online settings.
CONCLUSIONS/NEXT STEPS: Those living with HIV often take on educational roles within medical, professional, and informal settings. Resources such as Looped in present a way in which third sector organisations can support patient self-advocacy, and empower marginalised groups to assert their rights with accurate and trustworthy information.

STIGMA TOWARDS KEY POPULATIONS

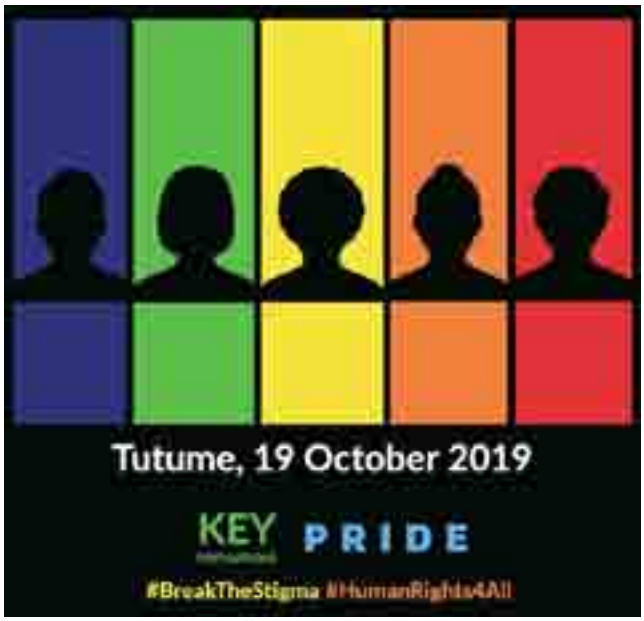
PEF1831

KEY POPULATION PRIDE - DIVERSITY AND INCLUSIVITY. #WEAREKPRIDE

U.A. Mashumba[1]
[1]Botswana Network on Ethics, Law and HIV/AIDS, Programs, Gaborone, Botswana

BACKGROUND: The campaign was carried out in one of the most rural areas in Botswana. The campaign came at a time when the area needed education around issues of key populations, their human rights and moreover to have a large scale event to show the importance of diversity in the are and how we can all come together and celebrate our differences. The campaign was targeting 200 KPs in the community. The objectives was to contribute to the reduction of stigma, discrimination, harmful gender norms and cultural norms that make key populations vulnerable. The most important objective was have an activity that played a bigger role on diversity and inclusivity of different key populations that came together to create a safe space.
DESCRIPTION: We redefined the word 'pride' not being your typical parade event that requires sexual/gender orientation disclosure, but to be a campaign that promotes inclusivity and diversity via games

and talks surrounding issues affecting all key populations. The discussions were around stigma and discrimination, human rights and we used games as communication breakers. We made use of the colours that represented different key populations. We invited different stakeholders in the area to bring their services and celebrate with us people who holds certain positions in the area.



LESSONS LEARNED: In a rural area where issues around sexuality, gender roles, sexual practises are not talked about; the campaign came at a right time to sensitise the community that we can coexist together and create a safe space for everyone in the community. It gave the community a chance to have conversations around key populations and be able to learn about their rights as well.

CONCLUSIONS/NEXT STEPS: Campaign that is targeting diversity and inclusivity works so much better as other key populations can be able to appreciate and learn about the rest of the community members.

PEF1832

STIGMATIZING ATTITUDES TOWARDS KEY POPULATIONS (KP) BY MOBILIZERS IN THE CONTEXT OF PREP: A COMPARATIVE ANALYSIS FROM A CROSS-SECTIONAL SURVEY IN KENYA

A. Musau[1], D. Were[1], J. Mutegi[1], J. Wambua[1], M. Strachan[2]
[1]Jhpiego, Nairobi, Kenya, [2]Jhpiego, Baltimore, United States

BACKGROUND: Stigma towards KP is common and has the potential to impede uptake and persistence on PrEP. Community health volunteers (CHVs) and peer educators (PEs) often champion awareness and demand creation for preventive interventions targeting their own communities and have been identified as stewards of PrEP scale-up within KP networks. However, little is known if and to what extent stigma by these mobilization cadres might affect the scale-up of PrEP among KP. This study examined the intersection of mobilizer cadre and stigmatizing attitudes towards KP within the context of Jilinde, a PrEP scale-up project in 10 counties of Kenya.

METHODS: Data were collected from PEs and CHVs through a cross-sectional survey. Stigmatizing beliefs, intentions and behavior towards KP were assessed using a 14-item Likert scale with five answer options, strongly agree, agree, neither agree or disagree, disagree and strongly disagree. The extremes of the scale were collapsed resulting to a score between 1-3 and a maximum score of 42 points. Composite scores for each participant were computed and factor analysis employed to generate latent variables grouped onto an ordinal scale; positive, neutral and negative attitudes based on their distribution. Ordered logistic regression analysis was conducted comparing stigma scores between PEs and CHVs controlling for multiple predictor variables.

RESULTS: Overall, 589 participants (292 CHVs and 297 PEs) completed the survey resulting in a response rate of 97.8%. Over half (52.1%) of participants were older than 35 years, majority were female (73.9%), never married (44.9%), and most (77.8%) had attained post-secondary education. On the ordered scale, 41.3%, 25.9%, and 33.6% held positive, neutral and negative attitudes respectively. Negative attitudes were universal in both cadres but PEs reported lower odds [OR 0.281(0.174-0.456)]. When controlled for the mobilization cadre, significant ($p<0.05$) higher odds of positive attitudes toward KP were associated with: age younger than 35 years; and, medium and high asset index scores.

CONCLUSIONS: Stigma is perpetuated by mobilizers, irrespective of their cadre, and has the potential to impede uptake and persistent use of PrEP among KP. The rapid scale-up of biomedical interventions demands concomitant implementation of stigma-reduction interventions targeting mobilizers to optimize intervention outcomes for HIV prevention.

PEF1833

STIGMA AND INTERVENTION STRATEGIES FOR ADDRESSING TRANSPHOBIA IN SCHOOLS: RECOMMENDATIONS FROM A QUALITATIVE STUDY IN SÃO PAULO, BRAZIL

J.L. Gonzalez Junior[1], G. Saggese[1], M.A. Veras[1], J.I. Pichardo[2]
[1]Faculty of Medical Sciences of Santa Casa, Collective Health, Sao Paulo, Brazil, [2]Complutense University, Madrid, Spain

BACKGROUND: Transgender people are one of the most vulnerable groups facing discrimination and aggression within the school environment. This includes gender identity disclosure threats, verbal insults and physical and sexual violence. Among the consequences are lower school performance, higher dropout rates, and poorer physical and mental health outcomes. In Brazil, school bullying is among the most noteworthy reasons why transgender students are unable to complete Basic Education, which means 12 years of education. The aim of this study is to analyze experiences of discrimination among transgender people during their school years, as well as outline a set of recommended interventions to address transphobia in the school environment.

METHODS: We analyzed 27 in-depth interviews (five transmen and 22 transwomen) of participants of the Muriel Project in six municipalities of the state of São Paulo, Brazil. The Muriel Project (2014-2016) was a cross-sectional study of the transgender population with the general objective of characterizing vulnerabilities and health demands. Discrimination reports during the school period were analyzed according to the Social- Ecological Model of Transgender Stigma & Stigma Interventions (SEM). This model classifies the types of stigma and interventions into structural (institutional policies and practices), interpersonal (direct forms of stigma) or individual (individual's feelings).

RESULTS: Structural, interpersonal and individual stigma were found in the reports of the participants during the school period. 24 out of the 27 participants reported having experienced verbal, physical or indirect bullying (including being locked in the bathroom with a bomb and forced sexual behavior). We outlined structural, interpersonal and individual interventions to address transphobia in schools, such as an institutional school policy against discrimination and bullying, the use of preferred names and pronouns, training on gender identity issues, commissions responsible for reports of student harassment, Gender and Sexuality Alliance (GSA) clubs, and counseling services.

CONCLUSIONS: A combination of the three intervention types (structural, interpersonal and individual) is required to address transphobia in schools. Increased structural interventions may lessen the need for interpersonal and individual interventions. At the same time, less structural and interpersonal stigma may mean fewer individual interventions for transgender students to meet their basic learning needs.

PEF1834

RESEARCHING AND REPORTING HIV RELATED RIGHTS VIOLATIONS PERPETRATED AGAINST SEX WORKERS: THE UNIVERSAL PERIODIC REVIEW

P. Saunders[1]
[1]*Best Practices Policy Project, Morristown, United States*

BACKGROUND: Sex workers in the United States have very limited mechanisms to affect HIV/AIDS policy in the country and are not included in national strategic planning. The Universal Periodic Review (UPR) is a United Nations session to hold member countries responsible for their human rights records. The US is being reviewed in 2020 for the first time in five years. The author is a key member of a team that researched and submitted a national shadow report to the United Nations about the human rights abuses sex workers face especially in regards to HIV/AIDS, stigma, criminalization and rights violations.

DESCRIPTION: The US is held up to global scrutiny in the UN system every five years via the UPR. This process allows civil society organizations to inform global States Parties directly about key human rights issues. In 2019, five civil society organizations led by sex workers designed a research protocol to gather data about human rights violations.

LESSONS LEARNED: We found that: the U.S. government has failed its obligations to protect the rights of sex workers living with HIV by enforcing heightened criminalization, detention, and barriers to health and social services; A highly problematic concern for the right to health, including the right to privacy regarding personal health information, is genetic sequencing and identifying clusters of HIV; and that sex worker led organizations and sex worker rights coalitions play a vital role in civil society in the U.S. providing services including in regards to HIV and defending human rights but that sex workers' right to assemble has been severely compromised by recent federal legal enactments and U.S. policies that heighten criminalization during public gatherings.

CONCLUSIONS/NEXT STEPS: Due to current hostile federal approaches to sex workers (including relatively recent legislation name FOSTA/SESTA preventing online speech for health and safety), transgender people, immigrants (including a crisis at the border), and challenges to science based HIV/AIDS approaches, research prioritized these areas in searching to document rights violations. A comprehensive report has been completed with findings and in 2020 sex workers will travel to Geneva, Switzerland to speak to member countries about the criminalization of our communities.

PEF1835

ADDRESSING STIGMA AND DISCRIMINATION TOWARDS KEY POPULATIONS THROUGH EMPOWERING LAW ENFORCERS AND MEMBERS OF KEY POPULATIONS: EXPERIENCE FROM RWANDA

S. Muhirwa[1]
[1]*Health Development Initiative, Key Populations, Kicukiro, Rwanda*

BACKGROUND: The risk of HIV acquisition in 2017 globally was estimated to be higher among men who key populations as compared to general populations. In Rwanda the prevalence of HIV among adults aged 15- 49 is approximately 3% and among MSM is estimated to be 4% and 45.8% among FSWs. Although homosexuality is not criminalized in Rwanda, KPs face extensive stigmatization and systematic discrimination. This in turn leads to poor health seeking behaviors and a reluctance to disclose their status and affect services tailored to this population.

DESCRIPTION: Multiple activities have been carried out around human rights to address stigma and discrimination towards key populations in Rwanda. This includes the workshop on human rights targeting law enforcers namely police, local leaders, lawyers and journalist and healthcare providers. Community Dialogues which brought together law enforcers, healthcare providers, media, etc and key populations members were held to discuss the strategies to end stigma and discrimination. Empowering key populations' members with law and policy awareness to advocate for their rights. Radio talks (live and recorded voices from members of key populations) were aired and most influential activists have been invited to talk and address barriers of access to health among key populations.

LESSONS LEARNED: Sensitizing local leaders and security agents has been impactful to human rights issues affecting KPs. Different parties are now working with key populations to jointly address issues. Empowering key populations members have been also productive because now they can help their peers claiming their rights before local leadership and security agents. Number of key populations reaching to services have increased due to a strong partnership between health facilities trained and key populations and fighting stigma among society. From 2017 live radio talks were performed almost every month in local radio to address issues affecting key populations including stigma and discrimination.

CONCLUSIONS/NEXT STEPS: Empowering law enforcement and members of key populations around human rights is a vital response to end discrimination and stigma towards key populations. Countries which have similarities of Rwanda, they can learn from such progress made in Rwanda to tackle human rights issues affecting key populations to accessing health services.

DISCRIMINATION TOWARDS KEY POPULATIONS

PEF1836

THE JOURNEY OF TRANS RIGHTS VIOLATION TO PROTECTION IN INDIA-EXISTING GAPS AND VULNERABILITIES OF THE COMMUNITY TOWARDS HIV/AIDS

S. Tamanna Gupta[1], Y. Singh[1], S. Parashar[1], S. Murugesan[1], A. Dange[1], V. Raj Anand[1]
[1]*The Humsafar Trust, New Delhi, India*

BACKGROUND: In 2014, the Supreme Court of India gave NALSA judgment which recognized Transgender persons as "Third gender" and gave the right to self-identification. It directed the Union of India to develop roadmap to uplift the marginalized Transgender communities. In 2016 UOI introduced "Transgender Persons (Protection of Rights) Bill" Transgender person which was widely opposed by communities across India on account of problematic clauses. Among transpersons, Transwomen continue to be vulnerable to HIV and marginalized due to rights violations.

DESCRIPTION: The clauses of "screening committee" to certify the gender of a Transgender person and "Family&Residence" that renders gender non-conforming children susceptible to violence from biological families are against fundamental rights stated in Articles 19&21 of Indian Constitution.

Penalties for sexual violence on transgender persons should be equivalent to existing penalties for sexual violence on women. Penalties for physical, verbal, emotional and economic abuse should be similarly commensurate with the punishments under existing laws. Specific atrocities that transgender and intersex people face must be defined and strictly penalized. **Due to a lack of social support and rights violations, young transpersons are vulnerable to HIV due to abuse and sex work.**

Free access to gender-affirming medical procedures, full insurance coverage, choice of m/f/separate wards for trans people in hospitals is needed. Currently, due to the absence of SRS SOP, Transpersons do not have access to proper medical care; experience long term damage to their health.

LESSONS LEARNED: Our ground experience reveals provisions of this bill are discriminatory, renders Trans women vulnerable to social, economic discrimination along with making them vulnerable to HIV/AIDS; unless rights are attained, the vulnerability cannot be reduced. Better collectivization of marginalized communities to approach courts against human rights violations; the national and state governments need to work with the community to develop conducive laws&policies.

CONCLUSIONS/NEXT STEPS: Various High Courts have passed judgments against the screening committee & granted marriage rights to Transgender people. At present community collectives are gearing up to challenge the act in courts. At a structural level, National & State Trans Rights Commissions vesting appropriate powers and comprising majority transgender members and representations from other identities will be effective in tackle atrocities & grievances.

PEF1837

COMBATTING STIGMA AND DISCRIMINATION TOWARDS PEOPLE WITH HIV THROUGH STRATEGIC LITIGATION

A. Stratigos[1]
[1]*HIV/AIDS Legal Centre, Surry Hills, Australia*

BACKGROUND: The HIV/AIDS Legal Centre (HALC) recognizes that despite rapid developments in HIV testing, treatment and prevention, people with HIV continue to face stigma and discrimination. Australia's *Disability Discrimination Act (Commonwealth) 1992* contains provision to prevent discrimination against people with HIV; there is also similar state legislation. HALC utilizes these laws to engage in strategic litigation, including against government bodies, private employers, medical/dental and personal services providers, educational institutions and insurers. The goal of the litigation is to achieve a desirable outcome for the individual with HIV and to affect systemic change.

DESCRIPTION: People with HIV contact HALC seeking assistance in discrimination proceedings. Proceedings are commenced in the appropriate jurisdiction and then progressed through the courts as necessary. Remedies sought include compensation for economic and non-economic loss, amendments to policies or procedures, a commitment to education and training around issues affecting people with HIV and, if relevant, the person's return to employment or the provision of the service originally requested.

LESSONS LEARNED: HALC has successfully represented clients in hundreds of cases, including of note cases involving: the removal of a discriminatory policy preventing health care workers with HIV from performing exposure prone procedures; the removal of a discriminatory policy preventing the post mortem reconstruction of a person with HIV following autopsy; lifting of restrictions on people with HIV working in the Defence Force; and refusal of certain insurance to people with HIV.

Case studies reveal that perpetrators of discrimination directed at people with HIV often felt justified in their actions and attempted to rely upon other legislation such a WHS, public health and, in the case of insurers and the defence force, provisions under the *Disability Discrimination Act* which allow discrimination in certain circumstances.

CONCLUSIONS/NEXT STEPS: The type and volume of ongoing complaints received demonstrates that ignorance around HIV remains prevalent in the Australian community. It is clear that ongoing legal representation in discrimination proceedings for people with HIV is necessary to restore dignity and respect to individuals who have been wronged and also to effect systemic change so that people with HIV can participate in the community on an equal basis with others.

PEF1838

POLICE VIOLENCE AGAINST TRANSGENDER WOMEN IN RIO DE JANEIRO, BRAZIL AND ITS ASSOCIATED FACTORS: THE EVAS STUDY

E. Peixoto[1], C. Souza[2], R. Mattos[3], V. Knupp[4], L. Velasque[2,1], E. Jalil[2], L. Monteiro[2], B. Grinsztejn[2], C. Castro[2]
[1]Federal University of the State of Rio de Janeiro, Quantitative Methods Department, Rio de Janeiro, Brazil, [2]Oswaldo Cruz Foundation, Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil, [3]University of Rio de Janeiro, Rio de Janeiro, Brazil, [4]Federal Fluminense University, Rio de Janeiro, Brazil

BACKGROUND: Police violence (PV) has been increasing in Brazil in the last years, especially in the Rio de Janeiro State, which is responsible for a quarter of cases in the country. PV mostly occurs in low-income areas and is associated with racism. It is a type of community violence which minorities are vulnerable to. Brazil is the leading country in mortality rates among transgender women (transwomen) worldwide. We aimed to evaluate the observed PV against transwomen and its associated factors in Rio de Janeiro, Brazil.
METHODS: This was a cross-sectional study conducted in 2019, which enrolled 108 transwomen aged 18+ years in Rio de Janeiro, Brazil. Trained interviewers applied an adapted socio-health-demographic survey based on the Juvipol questionnaire. Data analysis used logistic adjustment with a 5% significance level for having seen PV in the last 12 months at least once.
RESULTS: The prevalence of observed PV was 24.07% (95%CI16.99-32.93%). Seeing PV had a positive association with having been victim of racism more than once in the lifetime (AOR=6.85, 95%CI 2.22–21.10, p=0.001), with transphobia more than once in the lifetime (AOR=3.41, 95%CI 1.03–11.28, p=0.044), and with having more than high school education (AOR=4.76, 95%CI 1.03–21.87, p=0.045). Participants that reported a high passability were less likely to have seen PV (AOR=0.21, 95%CI 0.05–0.86, p=0.034).
CONCLUSIONS: The social context and discrimination are significantly associated with seeing PV. A high passability seems to have a protective association with the exposure to observe PV in the community. Clashes in the favelas affects the daily lives of millions of workers. As police is little prepared and prejudges transwomen as dangerous, sex workers or involved with drugs, those factors combined may ultimately contribute to higher violence against trans population.

PEF1839

VIOLENCE IN PUBLIC SPACES AGAINST TRANSGENDER WOMEN IN RIO DE JANEIRO, BRAZIL: AESTHETICS, RACE AND PASSABILITY

L. Velasque[1,2], E. Peixoto[1], C. Souza[2], R. Mattos[3], V. Knupp[4], E. Jalil[2], L. Monteiro[2], B. Grinsztejn[2], C. Castro[2]
[1]Federal University of the State of Rio de Janeiro, Quantitative Methods Department, Rio de Janeiro, Brazil, [2]Oswaldo Cruz Foundation, Evandro Chagas National Institute of Infectious Diseases, Rio de Janeiro, Brazil, [3]University of Rio de Janeiro, Rio de Janeiro, Brazil, [4]Federal Fluminense University, Rio de Janeiro, Brazil

BACKGROUND: Brazil has the highest homicide rate among transgender women (transwomen) worldwide. The intersection between HIV, race and passability is a potential trigger of violence due to stigma. We aimed to evaluate violence in public spaces against transgender women and its associated factors.
METHODS: This is a cross-sectional study that enrolled 108 transwomen aged 18+ years in Rio de Janeiro, Brazil, in 2019. All participants answered an adapted questionnaire on socio-health-demographic data and based on the Juvipol survey. We analyzed data using ordinal logistic regression adjustment with a 5% significance level for having been a victim of both open and closed public space violence.
RESULTS: Median age was 36.5 years (SD=10.46), and median monthly income was US$256.88 (IQR=271.20) . The frequency of violence in open public spaces was 34.0% never, 8.7% once, 30.1% occasionally, 27.2% very frequently and in closed public spaces was 34.0% never, 9.7% once, 30.1% occasionally, 26.2% very frequently. White participants and those with very high passability reported significantly less violence in open public spaces (respectively, AOR=0.31, 95%CI:0.11–0.87, p=0.025 and AOR=0.06, 95%CI:0.01–0.28, p<0.001). Violence in open public spaces was positively associated with very frequent discrimination due to physical characteristics (AOR=5.59, 95%CI:1.65–18.97, p=0.006) and very frequent aggression from strangers (AOR= 11.21, 95%CI:2.28–54.99, p=0.003). Violence in closed spaces was associated with occasional discrimination due to physical characteristics (AOR=3.83, 95%CI:1.39–10.52, p=0.009) and very frequent aggression from strangers (AOR= 12.45, 95%CI:2.59–59.91, p=0.002).
CONCLUSIONS: Violence has an association with aggression from strangers and discrimination due to physical characteristics. This violence specifically in public open spaces is also associated with low passability and non-white race/color, highlighting the need of taking into account racial and gender issues for more effective protection in open public spaces.

PUNITIVE LAWS AND ENFORCEMENT PRACTICES (INCLUDING CRIMINALIZATION OF HIV AND CRIMINALIZATION OF KEY POPULATIONS)

PEF1840

WAR ON DRUGS: OPPORTUNITIES IN ACCESSING TO HARM REDUCTION SERVICES FOR PEOPLE WHO USE DRUGS IN MOMBASA COUNTY

A. Karisa[1]
[1]Reachout Centre Trust, Harm Reduction, Mombasa, Kenya

BACKGROUND: The “war on drugs” has contributed to the poor health outcomes amongst the people who use drugs (PWUDs) and increased human rights violations. Law enforcement agency have created opportunities for corruption, generating money from the PWUDs thus contributing to high criminal activities. Negative publicity by the media fraternity contributed to increased stigma and discrimination.
DESCRIPTION: Reach out Centre Trust in partnership with Open Society Initiative for Eastern Africa, conducted a three days Justice Actors conference that brought 70 Judicial officers, Trainings and sensitization meetings for 300 senior police officers, 40 media personnel’s, 300 community members and 80 county police on human rights and Harm Reduction. RCT planned 2 exchange visits for 6senior police officers to KASH organization to learn on best practices on Harm reduction. Also engaged media personality Awards on health rights reporting for PWUDs and 5500 PWUDs were empowered on human rights through legal aid cafés. In addition, RCT also conducted routine weekly police visits.
By September 2019, there was a decline in human rights violations from 800 incidences in 2017 to 350 incidences in 2018, 50 incidences in 2019. 44.57% of 3500 drug cases were given alternative sentences

at the Mombasa County Law Courts.1200PWUDs arrested on petty offences were released unconditionally at different police cells. Minimum directives by the county commissioner on arrests and raids have been noticed. Presidential directives on drug war has targeted only drug barons.

LESSONS LEARNED: The meetings, conference and trainings provided a better understanding of harm reduction among the law enforcement agencies, the judiciary and the community thereby changing their mindsets and attitudes toward the PWUDs hence providing enabling environments for access to harm reduction interventions e.g. Methadone and rehabilitation programs. Law enforcers acknowledged the rights of PWUDs hence raids conducted don't infringe their rights. Involvement of community promotes access to harm reduction services. Media involvement has promoted uptake of harm reduction services and reduction of stigma and discrimination.

CONCLUSIONS/NEXT STEPS: Policies and laws should be reviewed to foster promotion and improving health outcomes. Training curriculum on Harm reduction should be incorporated within their police training centers. Judiciary needs more sensitization on harm reduction.

PEF1841

FIGHT AGAINST VIRUS OR HUMAN BEING? CASE STUDY ON HUMAN RIGHTS VIOLATION REGARDING HIV CRIMINALIZATION IN TAIWAN

Y.C. Chiu[1], Y.H. Lin[1], C.Y. Lin[2]
[1]Persons with HIV/AIDS Rights Advocacy Association of Taiwan, Taipei, Taiwan, Province of China, [2]Chung-Yuan Christian University, Department of Financial and Economic Law, Taoyuan, Taiwan, Province of China

BACKGROUND: Taiwan ranks top amongst the most progressive Asian countries, including being the first to pass marriage equality in Asia. Yet, stigma and discrimination of certain sub-populations, specifically people living with HIV (PLHIV) continue to prevail, as reflected in the *Article 21* of HIV special law which overly criminalizes HIV non-disclosure, exposure and transmission.

METHODS: Using qualitative and quantitative approaches, Persons with HIV/AIDS Rights Advocacy Association (PRAA) of Taiwan makes a case on how the current criminal justice system in Taiwan adapt the narrative of "HIV as a weapon" to prevent PLHIV from asserting their rights.

RESULTS: *Article 21* states that individuals with knowledge of their HIV-positive status, by concealing the fact, engage in unsafe sex with others or share injection syringes, diluted fluids, and thus infect others, shall be sentenced for 5 to 12 years. Data showed over 30 cases were identified from 2012 to 2019, the majority of prosecutions were associated with sexual activities. However, unsafe sex was often defined exclusively with use of condom, and the court rarely recognized scientific advancements in antiretroviral therapy and suppressed viral load. Cases included: prosecution from ex-partner whom knew defendant's HIV status before their relationship; state prosecution without plaintiff by turning 14 HIV-positive witnesses into defendants; 13-year incarceration despite medical expert's testimony on the unlikelihood of HIV transmission. Those who haven't been prosecuted continued to face both physical and emotional health threats, such as a woman threaten by her admirer to disclose her status if she turns him down. Bias and prejudice, worsen by difficulties in proving self-disclosure or condom use commonly resulted in convictions.

CONCLUSIONS: *Article 21* and out-of-date judicial interpretation of HIV transmission risks gravely deprive the rights of PLHIV and further perpetuates stigma against PLHIV and affected communities through special criminal law on HIV. There's a strong case to be made for abolishing *Article 21* under the Constitution of Taiwan and the International Bill of Human Rights. Training and support on HIV advancements shall be given to all members of judicial and criminal law system to further inform any application of criminal law in cases related to HIV.

PEF1842

ADVOCACY AMONG LAW ENFORCEMENT AGENTS IN MOROCCO IMPROVES PEOPLE WHO USE DRUGS' RIGHTS

M.A. Douraidi[1,2], A. Kandil[3], A. Ben Moussa[4,2], T. Brahni[1,2], H. Himmich[3,2], M. Karkouri[3,2]
[1]Association de Lutte Contre le Sida (ALCS), Advocacy, Casablanca, Morocco, [2]Coalition PLUS, Community Based Research Department, Paris, France, [3]Association de Lutte Contre le Sida (ALCS), Nador, Morocco, [4]Association de Lutte Contre le Sida (ALCS), Research, Casablanca, Morocco

BACKGROUND: Morocco is known to be the most important producer and exporter of cannabis worldwide yet one of the fewest countries implementing Harm Reduction (HR) programs in the MENA region. Nevertheless, national law punishes the use of psychoactive substances and one quarter of inmates are incarcerated for their use, which makes the People Who Use Drugs (PUD) more vulnerable. Association de Lutte Contre le Sida (ALCS), a major regional NGO, in collaboration with the National Council of Human Rights of Morocco, has conducted many advocacy activities at different levels in favor of a human rights approach.

DESCRIPTION: Besides meetings, letters, press releases, memorandums; two seminars were held bringing up the topics of the alternative and progressive sentences and raising awareness on laws to protect the right health of key populations, targeting decision-makers, Jurists, Members of Parliament, local elected Representatives and CSOs defending human rights.

All the activities organized in the north of the country (where the use of drugs population is concentrated) were with the presence and support of regional council Tangier-Tetuan-Al Huceima (TTA).

LESSONS LEARNED: The notable outputs are as followed:

- No incarceration for only consuming drugs (informal agreement); the number of the incarcerated cultivators has decreased.
- The PUD can finally dispose of their administrative papers.
- The opioid substitution therapy has been introduced in prison.
- Prevention of overdoses : the antidote is affordable.
- The National Direction of Police has released a circular to facilitate the activities of our field workers.
- The regional council of TTA has voted for launching a study on the cannabis medical and cosmetic opportunities.
- The recommendation of the review for the integration of the repeal of two prohibitionist laws in the penal code being discussed in parliament (2019-2020)

CONCLUSIONS/NEXT STEPS: Despite of the current oppressive legal environment, our advocacy based on the human rights approach, has been strengthening and improving the access to prevention and healthcare services for PUD.

PEF1843

THE EFFECT OF POLICE ENFORCEMENT PRACTICES ON SEX WORKERS' EXPERIENCES OF VIOLENCE: FINDINGS FROM A COHORT STUDY IN LONDON, UK

J. Elmes[1], R. Stuart[1], M.S. Sarker[1], K. Hill[1], P. Grenfell[1], L. Platt[1]
[1]London School of Hygiene and Tropical Medicine, London, United Kingdom

BACKGROUND: Globally, criminalisation of sex work and violence against sex workers, particularly sexual violence, is linked to increased risk of HIV infection. Using data from a prospective observational study, we examine violence against sex workers from clients and other perpetrators and their associations with police enforcement practices over time.

METHODS: Between May 2018-September 2019, we used time-location and convenience sampling to enrol sex workers (≥18 years) working in any sector (e.g. street, flats, saunas) in east-London into a two-wave open cohort with six-month follow-up. Bivariate logistic regression with generalised estimating equations was used to estimate the association between any recent police enforcement (any arrest, client-arrest, displacement from workplace, caution, item-confiscation, referral to services, or immigration detention in previous six months) and 1) recent physical and/or sexual violence from clients and 2) any recent emotional, physical, sexual violence from others (e.g. strangers, residents) occurring in the previous six months, adjusting for duration in sex work. All analyses are stratified by workplace-sector (street or indoor) and are restricted to women (including transwomen).

RESULTS: We include 197 sex workers in the analysis (median age 34 years), 50% completed a follow-up questionnaire (median 196 days after baseline). At baseline 97% were cisgender(cis)-women, 46% self-reported street-based sex work and 54% worked indoors in the previous 6 months. Living circumstances were particularly precarious for street sex-workers: 65% were homeless in the previous month (7% indoor sex-workers) and 74% used crack or heroin daily/nearly daily (3% indoor sex-workers). 87% of street sex-workers had experienced any recent police enforcement compared to 9% indoor sex workers. Recent physical/sexual violence from clients was extremely high (street:71%,indoor:35%) as well as any violence from others (street:65%,indoor:16%); only 13% reported violence to police. Adjusted analyses show that recent police enforcement was associated with increased physical/sexual violence from clients (OR_{street}3.7, 95%CI:1.3,10.2,p=0.01; $OR_{indoors}$3.4, 95%CI:1.1,10.6,p=0.04) and with any violence from others among street sex-workers (OR_{street}4.9, 95%CI:1.5,16.3;p=0.009).

CONCLUSIONS: In this diverse sample, enforcement and violence is highest against street sex workers who are the most marginalised, reinforcing existing inequalities. Across sectors, police enforcement is linked to increased risk of violence from clients and other perpetrators that is rarely reported.

PEF1844

THE RELATIONSHIP BETWEEN MIGRATION AND PREVALENT HIV INFECTION AMONG FEMALE SEX WORKERS ACROSS 10 SUB-SAHARAN AFRICAN COUNTRIES

C. Lyons[1], S. Schwartz[1], D. Diouf[2], T. Mothopeng[3], S. Kouanda[4], A. Simplice[5], A. Kouame[6], Z. Mnisi[7], U. Tamoufe[8], N. Phaswana-Mafuya[9], B. Cham[10], M. Aliu Djaló[11], S. Baral[1]
[1]Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States, [2]Enda Sante, Dakar, Senegal, [3]People's Matrix Association, Maseru, Lesotho, [4]Institut de Recherche en Sciences de la Santé, Ouagadougou, Burkina Faso, [5]ONG Arc-en-Ciel, Lome, Togo, [6]Ministère de la Sante et de l'Hygiène Publique, Abidjan, Cote D'Ivoire, [7]Health Research Department, Mbabane, Eswatini, [8]Metabiota, Yaoundé, Cameroon, [9]North-West University, Potchefstroom, South Africa, [10]ActionAid, Banjul, Gambia, [11]Enda Santé, Bissau, Guinea-Bissau

BACKGROUND: Globally HIV incidence is slowing, however HIV epidemics among sex workers are stable or increasing in many settings. Despite expanded access to antiretroviral therapy, sex workers across sub-Saharan Africa continue to have suboptimal HIV prevention and treatment outcomes. Studies have primarily focused on individual-level biological and behavioral risks for HIV among sex workers with limited examination of higher-level structural determinants. Migration can be driven by the legal and social environment, as well as through limited economic stability. Migration may increase vulnerability to HIV risk behaviors and other health outcomes.

METHODS: Respondent driven sampling was used to recruit 7529 female sex workers over the period of 2011-2018 across 10 countries: Burkina Faso, Cameroon, Côte d'Ivoire, Gambia, Guinea-Bissau, Lesotho, Senegal, eSwatini, South Africa, and Togo. Interviewer-administered socio-behavioral questionnaires and biological testing for HIV were conducted. Individual-level data were pooled across countries. Multivariable logistic regression models were used to measure the association migration and HIV.

RESULTS: Sex workers with a history of migration was highest in settings where sex work is criminalized (32.8%;1341/4087) compared to setting where selling sex is not legally specified(16.5%;208/1262) and where sex work is partially legalized(12.7%;242/1904). Migration was association with an increased odds of HIV (aOR:3.85; 95%CI:1.69,8.68; p-value=0.001) after adjusting for age, education, marital status, years in sex work, and clustering by site and country.

CONCLUSIONS: These data suggest increased vulnerability to HIV among sex workers with a history of migration. Structural determinants of HIV may drive migration as well as limit access to services and support across settings. Migration may also limit social capital and stability, and therefore increase vulnerability to HIV risks among sex workers. Support for the health and human rights of sex workers is needed in order to effectively address the HIV epidemic and limit new HIV infections.

CHALLENGING CRIMINALIZATION OF SEXUALITY, GENDER IDENTITY AND BODILY AUTONOMY AS DRIVERS OF HIV PROGRAMME EXCLUSION

PEF1845

BORN THIS WAY, PUNISHED FOR IT: CHALLENGING THE CRIMINALIZATION OF TRANSGENDER PERSONS AT THE EXPENSE OF THE HIV PANDEMIC

A.A. Chacha[1], Purple royale podcast team
[1]*Transsmart Trust Zimbabwe, Key Population Programming, Harare, Zimbabwe*

BACKGROUND: The criminalization of transgender persons in Zimbabwe has resulted in the neglect of this key population group thereby increasing the high risk to HIV as well as reducing our efforts in implementing effective HIV programming nationwide. Sex work has become the number 1 profession for over 90% transgenders in Zimbabwe due to social and economic exclusion. Undocumented cases of sexual assault towards transgender persons being another contributing HIV risk factor.

DESCRIPTION: The program is meant to provide an effective system that documents Transgender cases of stigma, discrimination and criminalization. 15 transgender persons nationwide were trained on how to administer a podcast, record audio diaries narrating lived in experiences of stigma, discrimination and criminalization when accessing HIV treatment or prevention as well as when being exposed to high risk of HIV in sexual assault cases and even during sex work. The 15 transgender members were also trained on doing interviews, dialogues and jingles which focus on a particular topic affecting the transgender community in Zimbabwe, topics on mental health, being transgender in Zimbabwe and What exposes one into sex work where discussed. As well as experiences in society, corrective rape and discrimination from family, educators, employers and even health care providers. Purple royale podcast is available at www.anchor.fm/purple-royale.

LESSONS LEARNED: From the purple royale podcast project, the key lesson learnt is that there is power in sharing your story and lived in realities. 90% of transgender persons are afraid to come out and share their experiences with stigma and discrimination for fear of further assault and anniliation. This has result in a lot of undocumented case studies which if recorded would help in providing effective HIV programming and policy reform for vulnerable communities, transgender persons included.

CONCLUSIONS/NEXT STEPS: The purple royale podcast has shown to be a useful in documenting and bringing to light the challenges the transgender community in Zimbabwe faces each day, putting us at high risk of HIV. It is a first hand evidence based approach to programming which can be used in advocacy, policy reform and sensitization. To scale up, the podcast needs sustainable funding and strategic partnerships for continuous improvement

INVESTING IN REGIONAL HIV PROGRAMMES AND REGIONAL KEY POPULATION MOVEMENTS

PEF1846

LEVERAGING REGIONAL SPACES TO ALSO EFFECT POSITIVE CHANGE AT THE NATIONAL LEVEL

L. Ferguson[1], W. Jardell[1], K. Zacharias[1], D. Owolabi[2], D. Patel[2], A. Saha[2], S. Gruskin[1]
[1]*University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States,* [2]*UNDP RSCA, Istanbul, Turkey*

BACKGROUND: Following the work of the Global Commission on HIV and the Law in 2013, UNDP has supported work on removing legal barriers to accessing HIV services in sub-Saharan Africa. Covering over 20 countries, this work includes regular convenings at the regional level of judges, lawyers, key populations and law enforcement personnel, as well as in-country work implemented through regional and local partners.

DESCRIPTION: We conducted an evaluation of the impacts of regional activity at the country level through a review of project documents and key informant interviews including civil society representatives, judges, lawyers, government officials, and UNDP staff.

LESSONS LEARNED: Regional-level work allows for peer-to-peer collaboration and support in ways that can foster change far beyond what can occur within countries alone. UNDP provides technical and financial support, with activities tailored differently depending on the type of stakeholder – e.g. training for lawyers is run by legal NGOs while, in their forum, judges themselves determine priority topics for discussion. Spillover effects are also important. For example, in 2014, the Africa Key Population Experts Group, comprising representatives of diverse populations, produced a Model Framework on HIV Prevention, Treatment and Care, which served as a key resource for the Regional Economic Communities' development of regional strategies such as the Minimum Standards for the Protection of Key Populations in the Southern African Development Community (SADC) Region, recently endorsed by the SADC Parliamentary Forum. Shifts in political power challenge the effectiveness of regional activities and ultimately their ability to foster positive change across and within countries. Arriving at consensus can be challenging if political agendas do not align. Understanding the potential impacts of regional networks in these instances further highlights the potential value of this work.

CONCLUSIONS/NEXT STEPS: Creating regional "safe spaces" provides people the opportunity for more open discussion and engagement on difficult topics than would be possible in national-level spaces. The sense of solidarity and the opportunities for participants to share experiences and learn from one another appear to have a catalytic effect on in-country work. Continued support and evaluation of regional-level activities, alongside national-level work, is an important avenue for supporting positive change in HIV-related legal environments.

ETHICAL ASPECTS AND STANDARDS IN RESEARCH (INCLUDING CLINICAL TRIALS)

PEF1847

INDIVIDUAL ASSENT SHOULD BE SUFFICIENT FOR PARTICIPATION IN PREP RESEARCH BY 15 TO 17 YEAR OLD MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN – A BRAZILIAN EXPERIENCE

E. Zucchi[1], L. Magno[2], D. Greco[3], L. Ferguson[4], I. Dourado[5], A. Grangeiro[6], U. Tupinambas[3], P. Massa[6], M. Greco[3], W. Ude[7], PrEP1519 Brazil Study Group
[1]Universidade Católica de Santos, Programa de Pós-Graduação em Saúde Coletiva, Santos, Brazil, [2]Universidade do Estado da Bahia, Departamento de Ciências da Vida, Salvador, Brazil, [3]Universidade Federal de Minas Gerais, Faculdade de Medicina, Belo Horizonte, Brazil, [4]University of Southern California, Institute on Inequalities in Global Health, Los Angeles, United States, [5]Universidade Federal da Bahia, Instituto de Saúde Coletiva, Salvador, Brazil, [6]Universidade de São Paulo, Faculdade de Medicina, São Paulo, Brazil, [7]Universidade Federal de Minas Gerais, Faculdade de Educação, Belo Horizonte, Brazil

BACKGROUND: PrEP demonstration studies conducted with vulnerable adolescents face ethical and legal constraints. We describe challenges concerning waiving informed consent (IC) in the review of the PrEP1519 study by ethics review committees (ERCs) and judicial institutions in Brazil.

DESCRIPTION: PrEP 1519 is a demonstration study to evaluate the effectiveness of PrEP among adolescent men who have sex with men (MSM) and transgender women (TGW) aged 15-19 years in three cities: São Paulo, Belo Horizonte, and Salvador. Fearing that, for adolescents under 18 years old, parental IC might threaten confidentiality regarding sexual orientation and/or gender identity thereby creating a risk of discrimination or violence, we requested a waiver of IC from the participating universities' ERCs. This was based on considerations of adolescents' discernment and autonomy to make informed decisions to prevent HIV infection and current policy that allows unaccompanied adolescents aged 13 or over to access post-exposure prophylaxis in public health clinics.

LESSONS LEARNED: Despite the ERCs being in favor of a waiver of parental IC and being permitted by existing regulations to provide one, they would not make this decision without a court order. The ERCs' decisions paid attention to the fundamental ethical principles of respect and non-maleficence, but, by transferring the accountability of waiving IC to judiciary institutions, did not fully address beneficence and justice. The Public Prosecutor's Office applied for a court order from the Juvenile Court for blanket parental consent for all individuals under 18 in the study, based on adolescents' fundamental rights to health and autonomy. The Court's decision in São Paulo was fully favorable. The other Courts allowed a waiver only to adolescents deemed at risk of violence/discrimination, requiring a justification on a case-by-case basis in Belo Horizonte.

CONCLUSIONS/NEXT STEPS: In the current global backlash against sexual and reproductive rights, it is critical that ERCs are sufficiently autonomous and empowered to fulfill their mandate of protecting human subjects in research while advancing scientific knowledge. Recourse to judicial action should not be required. Research depends on ERCs to help ensure the generation of evidence of public health effectiveness that also guarantees the respect, protection and fulfilment of participants' rights.

PEF1848

UPDATING ETHICS GUIDANCE FOR INTERNATIONAL HIV PREVENTION RESEARCH: RESPONDING TO SCIENTIFIC DEVELOPMENTS, SHIFTING NORMS AND THE CONTEXT OF THE EPIDEMIC

B. Brown[1], J. Sugarman[2], HPTN Ethics Working Group
[1]University of California, Riverside, United States, [2]Johns Hopkins University, Berman Institute of Bioethics, Baltimore, United States

BACKGROUND: The HIV Prevention Trials Network (HPTN), which has conducted extensive international HIV prevention research for over 20 years, developed an Ethics Guidance Document (EGD) to serve as a resource for relevant stakeholders. First issued in 2003 and revised in 2009, the EGD is an important source document regarding the ethical issues in HIV prevention research globally. Nevertheless, since the last version was issued there has been substantial progress in HIV prevention science (e.g., the efficacy of oral pre-exposure prophylaxis and treatment as prevention), revisions of major international ethics documents (e.g., Declaration of Helsinki, Council for International Organisations of Medical Sciences guidelines), advances in ethics scholarship, and important federal policy changes. Accordingly, the HPTN undertook a comprehensive review and revision of the EGD.

DESCRIPTION: The HPTN's Ethics Working Group, which includes members with expertise in the ethics of HIV-related research, critically reviewed the EGD in light of emerging HIV prevention science, ethics guidance, ethics scholarship and new policies and regulations. A draft version was circulated among HPTN scientists, support staff and community representatives and revised. A subsequent draft was revised after review by international stakeholders with expertise in ethics, HIV prevention research and community engagement.

LESSONS LEARNED: The final version of the EGD includes updated guidance across the continuum of research:

1) High-quality scientific and ethical research;
2) Research objectives and priorities;
3) Community engagement;
4) Local capacity and partnerships;
5) Study design;
6) Consent, assent, permission and re-consent;
7) Addressing vulnerabilities;
8) Ethical review of research;
9) Standard of prevention;
10) Standards of care and treatment;
11) Independent data and safety monitoring;
12) Disseminating research results;
13) Sustaining capacity-strengthening and infrastructure;
14) Continuing care for research participants; and
15) Post-trial access to effective interventions.

These guidance points delineate specific ethical obligations and aspirations for different stakeholders (researchers, sponsors, study teams, community representatives) that are sensitive to the current context of HIV prevention research.

CONCLUSIONS/NEXT STEPS: The new EGD is positioned to help ensure that HIV prevention research is ethically sound, despite the inherent challenges faced. Next steps will include wide dissemination, implementation during research and continued critical review as needed.

PEF1849

SEXUAL VIOLENCE AND HIV RISK: ETHICAL PRACTICES FOR ENGAGING SURVIVORS OF SEXUAL TRAUMA IN HIV RESEARCH

K.M. Anderson[1], M. Young Karris[1], A. Fernandez DeSoto[1], J.K. Stockman[1]
[1]University of California, Department of Medicine, Division of Infectious Diseases and Global Public Health, La Jolla, United States

BACKGROUND: Survivors of sexual trauma face increased susceptibility to HIV due to behavioral and biological mechanisms, though the biological mechanisms remain understudied. Engagement of survivors of sexual trauma in research on HIV is imperative to increase understanding of these mechanisms. However, involvement in such research may cause re-traumatization or distress to survivors. The THRIVE Study seeks to engage female survivors of sexual violence in HIV research during the acute period post-violence, through research designed to minimize adverse participatory effects.

DESCRIPTION: The THRIVE Study is a prospective case-control study of women ages 14-45 who have experienced recent vaginal trauma or consensual vaginal penetration. Women participate in three study visits over three months, where they complete a survey and biological sample collection, including HIV testing. Survey data includes sexual behavior and trauma history, HIV risk behaviors, and HIV prevention behaviors. Study activities are constructed to minimize distress to participants while fulfilling obligations for transparency and appropriate service referrals, including discussions about HIV risk and prevention.

LESSONS LEARNED: Ethical engagement of survivors of sexual trauma in research necessitates the careful implementation of trauma-informed practices. In the context of sexual trauma and HIV, these include:

1) choice regarding information conveyed to study participants and method of conveyance, including HIV test results, and maintaining and reminding survivors of options regarding participation and non-participation in any part of the study;

2) transparency about study topics, goals, and outcome measures, particularly as they relate to HIV status, risk factors, and protective behaviors;

3) sensitivity to the timing of trauma in relation to topics discussed, including acknowledgement of the lifelong impacts of trauma, by delaying sensitive questions (e.g., use of post-exposure prophylaxis after potential exposure when a survivor is outside of eligibility window) to the end of surveys, limiting them to follow-up visits, or preparing survivors prior to sensitive topics; and 4) provision of support, guidance, and referrals relating to risk and prevention of HIV and other health outcomes.

CONCLUSIONS/NEXT STEPS: In order to facilitate engagement of survivors of sexual trauma in research on HIV, researchers must strive to meet the unique, ethical needs of survivors through trauma-informed practices.

PEF1850

ADOLESCENTS AND YOUNG ADULTS IN KENYA DEMONSTRATE GOOD COMPREHENSION OF RISKS AND BENEFITS OF PARTICIPATING IN HIV RESEARCH

J. Dyer[1], S. Shah[2], K. Agot[3], K. Wilson[4], R. Bosire[3], J. Badia[3], I. Inwani[3], K. Beima-Sofie[4], G. John-Stewart[4,5,6,7], P. Kohler[4,1]
[1]University of Washington, Department of Child, Family, Population Health Nursing, Seattle, United States, [2]Northwestern University Medical School, Bioethics, Chicago, United States, [3]Impact Research and Development Organization, Kisumu, Kenya, [4]University of Washington, Department of Global Health, Seattle, United States, [5]University of Washington, Department of Medicine, Seattle, United States, [6]University of Washington, Department of Epidemiology, Seattle, United States, [7]University of Washington, Department of Pediatrics, Seattle, United States

BACKGROUND: Participation of adolescents and young adults (AYA) in research is critical to ensure health interventions are tailored to population needs. In Western Kenya, where research consent is commonly restricted to those 18 and older, a high proportion of AYA ages 10-17 attend HIV clinics without caregivers, posing challenges to recruitment. To support waiver of parental permission it is important that adolescents have sufficient understanding of research to provide valid consent. We assessed and compared AYA and primary caregiver understanding of key information provided during the consent process.

METHODS: The DiSC cohort includes AYA (ages 10-24) and primary caregivers of AYA attending HIV care at nine facilities Western Kenya. During recruitment, study staff read the consent/assent form aloud and summarized each section. Individual comprehension was assessed by asking four questions on key elements of the study: purpose, procedures, benefits, and risks. Responses were electronically marked either “understands” or “does not understand” using a pre-specified rubric (1-point per question). For each inadequate answer, staff re-read relevant sections and re-assessed comprehension prior to enrollment. Linear regression was conducted to investigate the relationship between initial comprehension scores and participant age group.

RESULTS: Among 1264 AYA, 27.3% were 10-14, 29.0% were 15-17, and 43.7% were 18-24 years old; among 164 caregivers median age was 40 (IQR=35-47). Among AYA and caregivers who engaged in the informed consent or assent process, 451 AYA (35.7%) and 34 caregivers (20.7%) missed at least one question on the first attempt ($p<0.001$). Compared with caregivers, who had an average score of 3.76 out of 4, 10-14 year olds had a significantly lower comprehension score (score=3.11, difference=0.65, $p<0.001$). Both 15-17 year olds (score=3.62, difference=0.15, $p=.01$) and 18-24 year olds (score=3.65, difference=0.11, $p=.03$) had marginally lower comprehension scores than caregivers.

CONCLUSIONS: In this study, adolescents 15-17 years old had similar comprehension of research procedures, risks, and benefits as young adults and caregivers. For low risk research with AYA ages 15-17, these data provide reassurance that waiving parental permission requirements will not compromise the ethical need to ensure understanding of research prior to enrollment, and may allow this population greater access to research benefits.

POLICIES REGARDING HIV SERVICES AND PROGRAMMES

PEF1851

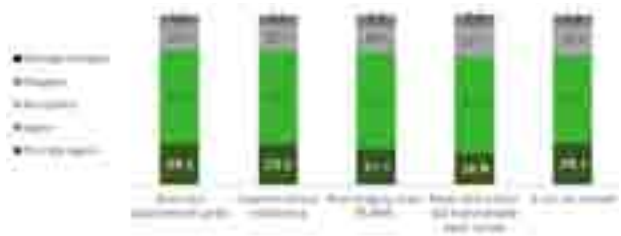
ACCEPTANCE OF BIOMETRICS INTEGRATION IN HIV PROGRAMMING AMONG KEY POPULATION IN NIGERIA

T. Alamu[1], O. Ugege[2], O. Airoje[3], O. Irinoye[2], B. Ochonye[4], N. Bouacha[5], J. Stapleton[5]
[1]Heartland Alliance International, Strategic Information and Knowledge Management, FCT, Nigeria, [2]Heartland Alliance, Strategic Information and Knowledge Management, FCT, Nigeria, [3]Palladium, M&E, FCT, Nigeria, [4]Heartland Alliance Nigeria, Chief Executive Office, Abuja, Nigeria, [5]Heartland Alliance International, M&E, Chicago, United States

BACKGROUND: The use of biometrics enhances the quality of health care delivery and patient monitoring. Although biometrics can enhance the accuracy of HIV surveillance, it is also associated with the risk of stigma and concerns about use of data for punitive measures. There are no public policies on the use of biometrics for health purposes in Nigeria. This study is to determine the awareness and acceptance of Biometrics Information System by key populations in Nigeria.

METHODS: Cross-sectional study with the use of closed ended and anonymous questionnaire to generate quantitative data from 555 key populations (177 female sex workers; 178 men who have sex with men; 153 persons who inject drug; 23 transgenders; 24 inmates) who were currently accessing HIV comprehensive care and treatment in Heartland Alliance One Stop Shops in three states in Nigeria. Respondent gender proportion (Male 55.3%; Female 44.5% and Genderqueer 0.2%). Prior to the study there was an ethical approval from the Federal Ministry of Health and Data analysis was done using SPSS v 25.

RESULTS: Majority (79.1%) of the respondents attained secondary school level and their awareness rate of biometrics is very high (82%). Also, 100% of respondents who were aware of biometrics had used biometrics for data capturing in the past, and 83.8% were willing to use biometrics to capture their healthcare data. Willingness is the only significant factor to high acceptance rate pvalue (0.00), chi-square 185.499 with 95% confidence interval.



[Figure 1: Perception of respondents to integration of biometrics into HIV programming.]

CONCLUSIONS: Biometric data capturing was acceptable by the majority of key populations. For program purposes, it may be important to design an alternative form of data capturing for the significant few who may not be willing to use biometrics for the capture of their health information.

PEF1852

GREATER INVOLVEMENT OF PLHIV IN ART SERVICE DELIVERY: ROLE OF MODELS OF HOPE IN ART SERVICE DELIVERY - THE ASHANTI AND BRONG AHAFO EXPERIENCE

O. Graham[1], T. Nyarko[2], D. Bandoh[3]
[1]Ghana AIDS Commission, Technical Servicesices, Kumasi, Ghana, [2]Ghana AIDS Commission, Research Monitoring and Evaluation, Kumasi, Ghana, [3]Ashanti Regional Health Directorate, Health Information, Kumasi, Ghana

BACKGROUND: The important role that Models of Hope (MOH), who are trained PLHIV involved in the provision of ART services, at ART center cannot be overemphasized. It is however clear from information gathered at some facilities visited that the MOH do not get the required recognition and remuneration as their services are deemed supplementary and voluntary as such only receive stipends from running projects. When the project ends, the stipends ends. This abstract seeks to bring to the fore the critical and lifesaving functions played by MOH in the overall delivery of ART services.

DESCRIPTION: The Brong Ahafo and Ashanti Social Accountability Monitoring Committees, which is part of Community System Strengthening (CSS) project under the Global Fund NFM, in September and October 2016 undertook monitoring visits to 12 and 11 ART facilities in their respective Regions. An interview guide was developed for both the MOH and Health staff at the ART facilities visited to elicit information on the quality of service delivery and to ascertain the role of MOH in the facilities. A meeting of all MOH was held and members were put into groups of 6 for focus group discussion.

LESSONS LEARNED: MOH in all facilities do home visits and provide home based care for bedridden clients. They collect and deliver drugs to clients. They assist with retrieval of client folders, disclosure, adherence counselling, checking and recording of client vitals. They also trace lost to follow up clients and bring them back into care. They therefore play a key role in the continuum of care for PLHIV. Nurses, doctors and data officers of the 23 facilities acknowledged that service delivery will be difficult without the services of the MOH.

CONCLUSIONS/NEXT STEPS: The services of MOH at ART centers is significant for the provision of quality health care for PLHIV which will ultimately improve the life expectancy of PLHIV and reduce new infections. The involvement of PLHIV in the provision of ART services cannot therefore be relegated to the periphery with no remuneration. A formal arrangement should be put in place to deploy MOH to all ART Centres and mainstream their remuneration.

PEF1853

ADDRESSING BARRIERS TO HIV CARE THROUGH COMMUNITY ENGAGEMENT AND RAPID SERVICE IMPROVEMENT: LESSONS FROM VIETNAM'S FIRST COMMUNITY ADVISORY BOARD

D. Thi Nhat Vinh[1], H. Viet Anh Kha[2], V. The Linh[3], N. Ly Lai[1], D. Thi Phuong[1], N. Asia[4], V. Thi Tuyet Nhung[1], L. Cosimi[5], S. A. Naz-McLean[5], T. M. Pollack[1], N. Kieu Uyen[3]

[1]The Partnership for Health Advancement in Vietnam and Beth Israel Deaconess Medical Center, Ho Chi Minh City, Vietnam, [2]The Community Advisory Board, Binh Duong, Vietnam, [3]Binh Duong Provincial AIDS Center, Binh Duong, Vietnam, [4]The US Centers for Disease Control and Prevention, Hanoi, Vietnam, [5]The Partnership for Health Advancement in Vietnam, Brigham and Women's Hospital and Beth Israel Deaconess Medical Center Boston, Massachusetts, United States

BACKGROUND: As Vietnam makes progress toward the global 90-90-90 goal, meaningful engagement with people living with HIV (PLHIV) and members of key populations (KP) is critical. By bridging the gap between patients and providers, the health system will be better equipped to understand and address barriers to care, improve access and retention. In 2019, the Binh Duong Provincial HIV/AIDS Center (PAC), and the Binh Duong Department of Health established Vietnam's first Community Advisory Board (CAB). The objective of the CAB is to create a forum where PLHIV and members of KP can actively participate in efforts to address healthcare quality, reduce stigma and discrimination, and improve community health outcomes.

DESCRIPTION: The CAB was launched in April 2019 comprising 12 PLHIV representatives working across four public HIV outpatient clinics (OPCs) in the province. The CAB's responsibilities are to 1) collect and review patient feedback, 2) communicate findings to healthcare facilities and PAC, 3) collaborate with OPCs to develop strategies to improve service quality, 4) communicate health initiatives and resources to PLHIV and KP in the community.

LESSONS LEARNED: Between April-September 2019, CAB members collected 312 patient feedbacks and regularly met with health care staff. Two salient themes emerged: Structural barriers to care (e.g. hours of operation, long wait times) and confidentiality lapses in OPC waiting rooms. With support of the CAB, the OPCs implemented:

1) expanded hours of operation, and

2) full time pharmacy staff, resulting in a reduction in medication pick-up time from 60 to 17 minutes, and

3) the use of ID codes rather than names to increase privacy in the waiting rooms.

These changes were quickly reported back to the community via the CAB

CONCLUSIONS/NEXT STEPS: The early outcomes of the Binh Duong CAB led to better communication between health staff and patients and rapid improvements to clinic services. Future efforts will include expansion of the model to additional provinces and increased use of the CABs to provide community education on services such as PrEP, HIV and viral load testing, and raising awareness of Undetectable=Untransmittable.

PEF1854

ARE RISK REDUCTION POLICIES MEETING THE NEEDS OF HIV-POSITIVE MEN WHO HAVE SEX WITH MEN IN THE PHILIPPINES?

A. Adia[1], I. Quilantang[2], E. Yoshioka[1], A. Restar[1], J. Nazareno[1], D. Operario[1]

[1]Brown University School of Public Health, Providence, United States, [2]University of the Philippines, Manila, Philippines

BACKGROUND: For decades, the Philippines had few documented cases of HIV, including during the global HIV crisis. Currently, however, the Philippines is currently undergoing one of the fastest growing HIV epidemics in the world, with the vast majority of cases concentrated among men who have sex with men (MSM). Because the country had few documented cases of HIV until recent times, few structures and interventions were in place prior to the current epidemic that can be utilized to address the rise of HIV among key populations including MSM. Given this, this research examined the needs that HIV-positive MSM still need after existing interventions, which mostly focus on provision of free or low-cost medications, health services, and condoms.

METHODS: We present findings from interviews with 21 HIV-positive MSM Manila, Philippines regarding their perceptions of success of existing policies and programs targeting them and their perceived needs for other policies and programs.

RESULTS: While existing interventions were noted as helpful, HIV-positive MSM noted a variety of needs that were currently going unaddressed by policy. These included how to navigate disclosure of HIV status without being put at risk, how to negotiate the use of condoms with sexual partners, and how to disclose to family and friends. Respondents discussed various ways in which these unaddressed needs directly impacted the effectiveness of existing efforts like provision of condoms and free or low-cost health services. Delivery of information and educational components to youth in schools or other settings as well as social media were identified as particularly desired pathways to deliver needed information. Because these needs were largely unaddressed by existing government efforts to address HIV, community-based organizations have stepped in to address some of these needs. These findings are compared to existing efforts to identify ways to improve the HIV response.

CONCLUSIONS: These findings emphasize the need for behavioral interventions like education and support for MSM with HIV to ensure that biomedical components like provision of free condoms and free or low-cost health services are leveraged to produce maximum impacts on MSM with HIV, with implications for the Philippines and similar settings.

PEF1855

LESSONS LEARNED IN 9 YEARS OF EXTERNAL QUALITY ASSESSMENT FOR HIV, SYPHILIS AND HEPATITIS C RAPID DIAGNOSTIC TESTS IN BRAZIL

Á. Bigolin[1,2], P.C. Gaspar[1,3], M. Villares[1], J. Boullosa Alonso Neto[1], R.C. Messores Rudolf de Oliveira[2], M. Valmorbida[2], F. de Rocco[2], H. de Melo Machado[2], M.A. Schörner[2], T. Freitas Medeiros[2], M.L. Bazzo[2], G.F. Mendes Pereira[1]
[1]Brazilian Ministry of Health, Department of Diseases of Chronic Condition and Sexually Transmitted Infections, Brasília, Brazil, [2]Federal University of Santa Catarina, Postgraduate Program in Pharmacy, Florianópolis, Brazil, [3]University of Brasília, Postgraduate Program in Collective Health, Brasília, Brazil

BACKGROUND: Between 2011 and 2019, the Ministry of Health of Brazil (MoH) provided approximately 148 million rapid diagnostic tests (RDT) and implemented the National Program of External Quality Assessment for RDT (EQA-RDT) to monitor the quality of the RDT for HIV, Syphilis and Hepatitis C (since 2018), performed mainly in primary healthcare units. EQA-RDT encompasses theoretical and practical rounds.

DESCRIPTION: In practical rounds, healthcare professionals receive a panel with four dried tube specimens with unknown reactivity and test the samples as in a real daily routine. In theoretical rounds, they answer an online survey with ten questions about RDT procedures and guidelines. The participants submit results/answers through an online platform. A certificate of approval is issued in the event of 70% accuracy/hits. Professionals with non-satisfactory performance receive a report suggesting possible causes of failure and issues to be avoided. In theoretical rounds, participants receive the right answers commented to all questions.

LESSONS LEARNED: MoH financial support and program management in the 20 rounds to date have ensured the sustainability of the EQA-RDT along those 9 years. To reduce costs and prevent losses, since round 17, the delivery of some panels was decentralized to regional reference service to redistribute for local services, leading to 25% of savings in shipping costs in the last round. Also, in 2015, MoH developed a free of charge distance-learning course about EQA-RDT aimed at nurses and nursing technicians – the majority of the professionals who perform RDT – which often have little knowledge of quality control procedures. By December 2019, more than 17,000 people had been certified. In the last practical round, there were 2,195 participants and over 90% approval, achieving a high level of RDT quality. Sending feedback on theoretical rounds turned out to be an important learning tool for clarifying questions and preventing future errors.

CONCLUSIONS/NEXT STEPS: An EQA-RDT program with an educative system allows the MoH to direct policies for quality improvement, prioritizing retraining of professionals that had non-satisfactory performance. Constant improvements in the program have enabled better adherence, prevented losses, and substantial savings. This experience could be useful to other countries as to improve the quality of testing services.

PEF1856

INSTITUTIONALIZE KEY POPULATION LAY PROVIDERS IN THAILAND TO SUPPORT ENDING AIDS: FROM PILOT TO POLICY AND PRACTICE

S. Pengnonyang[1], G. Carl[1], T. Sungsing[1], R. Matukul[1], S. Waewklaihong[1], D. Linjongrat[2], T. Chaisalee[2], V. Bunsirithanarot[2], P. Chanlearn[3], P. Patpeerapong[3], R. Apiputthipan[3], S. Janyam[4], C. Phaengnongyang[4], D. Srikrongthong[4], S. Sookthongsa[4], M. Sanguankwamdee[5], R. Vannakit[5], S. Tanprasertsuk[6], S. Wattanayingcharoenchai[6], N. Phanuphak[1], P. Phanuphak[1]
[1]USAID Community Partnership Project, PREVENTION, Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [2]Rainbow Sky Association of Thailand, Bangkok, Thailand, [3]Mplus Foundation, Chaing-Mai, Thailand, [4]Service Workers In Group (SWING) Foundation, Bangkok, Thailand, [5]The U.S. Agency for International Development/Regional Development Mission for Asia, Bangkok, Thailand, [6]Ministry of Public Health, Department of Disease Control, Nonthaburi, Thailand

BACKGROUND: Key population-led health services (KPLHS) has been identified as a critical strategy for ending AIDS in Thailand. Services provision by key population (KP) lay providers did not have legal sanction without project-based guardianship. We summarized the steps taken to secure legal endorsement of KP lay providers in KPLHS in Thailand.

DESCRIPTION:

- In 2015, KPLHS model designed by men who have sex with men (MSM) and transgender women (TGW) communities was established in 4 HIV-strategic provinces under USAID LINKAGES Thailand Project.
- In 2017, "ENGAGE", the technical support and advocacy platform supported by USAID Community Partnership Project, established capacity building and certification system for KP lay providers to perform HIV/STI testing and dispense pre-/post-exposure prophylaxis (PrEP/PEP).
- In 2018, 55% of HIV testing and 55% of PrEP provisions among MSM and TGW in Thailand were conducted by KP lay providers. Large uptake of HIV testing and PrEP among KPs through KPLHS, in comparison to uptake at conventional services, have been vital in ENGAGE's advocacy for the policy shift to legalize KP lay providers.
- Prof. Emeritus Praphan Phanuphak, Director of the Thai Red Cross AIDS Research Centre, was recruited as a "policy influencer" to have both formal and informal dialogues with the Minister of Public Health, the Director General of the Department of Disease Control and other key high level of policy makers to address the concerns of the professional medical councils.
- In 2019, A ministerial regulation sanctioning KP lay providers' roles was signed by the Minister of Public Health on June 6, 2019 and promulgated in the Ministry's gazette in September 2019.

LESSONS LEARNED:

- National-level impact of the KPLHS, as well as formal capacity building and certification systems, were critical to the legal endorsement of KP lay providers.
- The "policy influencer" was instrumental in leading advocacy efforts to success within 1 year. Continuous engagement with key stakeholders and professional medical councils reduced the resistance to policy change.

CONCLUSIONS/NEXT STEPS: With KPLHS capacity building, certification and legalization formally established in Thailand by ENGAGE, domestic financing directly to KP-led organizations is being piloted. This will lend support to the scale-up and sustainability of KPLHS.

PEF1857

HARM REDUCTION AND LAW ENFORCEMENT IN THE COUNTRY OF GEORGIA

M. Gogia[1], T. Kasrashvili[1], T. Zurashvili[1], K. Kvashilava[1]
[1]*Georgian Harm Reduction Network, Tbilisi, Georgia*

BACKGROUND: Georgia belongs to the list of countries with high injecting drug use prevalence (2.24%). Drug consumption is criminalized and people who use drugs are marginalized and stigmatized in the country. Start of HIV and HCV epidemic is mostly affiliated to drug injection practice. Under strong civil society pressure Government had to act and National HCV elimination program took a start from 2015. Strict drug law environment represented a significant obstacles for PWID to receive needed services.

DESCRIPTION: Georgian harm reduction network-GHRN delivers comprehensive harm reduction package to 30,000 PWIDs annually. From 2008 GHRN takes the leading role in drug policy change in the country. To support implementation of harm reduction and HCV elimination programs in 2015 GHRN initiated high level dialogue with law enforcement representatives.

LESSONS LEARNED: As a result of high level dialogue there was created an internal decree notifying all police departments not to hamper working of harm reduction programs, namely not to chase outreach workers, mobile ambulatories, program clients, not to make control raids in harm reduction service sites. The situation has changed for the better, the number of PWIDs at harm reduction sites and HIV/HCV testing increased 2 times. HCV elimination program was used as effective subject to initiate collaboration between harm reduction and Police. In 2017 GHRN with the support of EHRN implemented a drug policy study visit in Prague with participation on law enforcement agencies and ministry of health. in 2019 Ministry of justice had approached CHRN to initiate memorandum of collaboration to ensure effective linkages to harm reduction sites among ex-prisoners arrested due to drug related crime/drug consumption.

CONCLUSIONS/NEXT STEPS: Despite of existing punitive drug policy in the country NSP program continues its effective work. Government's good will to eliminate HCV in the country revealed to be a trigger to initiate high level dialogue among policy and decision makers. Collaboration with Ministry of Justice will support to reach hidden PWID population and increase harm reduction program coverage to support their better accessibility to vitally important health and social services. Further advocacy to change drug policy in the country should be continued in future.

PEF1858

BUILDING RESILIENT SYSTEMS IN THE FIGHT AGAINST HIV IN SOUTH AFRICA BY POSITIONING SOCIAL SERVICE PRACTITIONERS IN THE NATIONAL HIV TESTING SERVICES GUIDELINE

K. Lekalakala[1], B. Futshane[2]
[1]*PACTSA, Tshwane, South Africa,* [2]*Department of Social Development, Social Development, Tshwane, South Africa*

BACKGROUND: Despite having the world's largest antiretroviral treatment programme, South Africa still faces persistent challenges: among others, approximately 13.1% of its population is living with HIV, with children and young women particularly vulnerable. An unintended effect of the robust antiretroviral treatment programmes was the increased perception, especially among social service practitioners (SSPs), that HIV was exclusively a medical problem. Compounding the issue was the absence of HIV intervention guidelines for SSPs, which contributed to a scattered social service response for orphans, vulnerable children, adolescents and youth (OVCAY). Taken together, this has resulted in a weak system, unable to cope with South Africa's persistent HIV challenge. In response, the Department of Social Development (DSD) developed and implemented HIV Testing Services guideline for SSPs to provide a roadmap for a multidisciplinary and integrated response to HIV testing, treatment and adherence, which succeeded in building a more resilient social service system able to adapt to the needs of those affected by HIV.

DESCRIPTION: The goal of the HTS guideline is to sustain a system enabling psychosocially well-adjusted children, adolescents and youth who know their HIV status, enjoy good health and are resilient. It guides and structures SSP interventions to carry out the mandate of the DSD to improve access to HIV testing, treatment and adherence support for OVCAY within a legal framework, guided by SSPs respective professional values and principles.

LESSONS LEARNED: Positioning SSPs in the HIV space required national guidelines detailing their involvement throughout the social service value chain. Disengagement from HIV interventions created knowledge gap amongst SSPs ranging from basic HIV and AIDS knowledge to how to support families through disclosure and adherence processes, creating service gaps for unmet psychosocial needs that perpetuated the HIV epidemic.

CONCLUSIONS/NEXT STEPS: Achieving HTS goal and meeting the United National 90-90-90 targets in South Africa, requires consistent, well-coordinated intervention by skilled health practitioners and SSPs. A strong and integrated guideline provides the necessary framework to enable SSPs to contribute to the fight against HIV, especially in a political and legal environment in which SSPs were never considered to be part of what was perceived as an exclusively medical challenge.

PEF1859

UKRAINE HIV PREVENTION SHADOW REPORT 2019. 10-POINTS PLAN VS REALITY

A. Basenko[1], M. Cassolato[2], C. Morrison[2], A. Dmitriieva[3], P. Skala[1], M. Andrushchenko[1], M. Semeniuk[1], O. Dymaretskii[4]
[1]*Alliance for Public Health, Policy and Partnership, Kyiv, Ukraine,* [2]*Frontline AIDS, Brighton & Hove, United Kingdom,* [3]*Alliance for Public Health, Kyiv, Ukraine,* [4]*Ukrainian Network of People who Use Drugs (VOLNA), Kyiv, Ukraine*

BACKGROUND: Ukraine has the second largest HIV epidemic in EECA region. The last year has seen encouraging progress for HIV prevention in Ukraine, but a lot remains to be done. The gradual transition from donor to domestic funding is securing the sustainability of the HIV response. The adoption of social contracting mechanisms is expanding the role of civil society organisations in the provision of stigma-free services to marginalised people. However, significant barriers remain in the legal environment. Sex work and drug use are still criminal offences, and the government has not announced concrete plans to address this. Civil society is also worried that the country does not have a clear plan to address capacity gaps and weak accountability systems.

DESCRIPTION: In 2017, governments, civil society, UN agencies and donors launched the Global HIV Prevention coalition to accelerate progress towards the global target to reduce new HIV infections.

The Coalition endorsed the HIV Prevention 2020 Road Map which acknowledges common barriers to progress including lack of political leadership; enabling laws and policies; and funding for the implementation of combination prevention programmes. The Road Map commits countries to a 10-point plan. This shadow report sets out a civil society's perspective on how Ukraine performed in 2019.

LESSONS LEARNED: The report prepared with support of PITCH partnership as a desk review and community experts assessment from 8 national CSOs

CONCLUSIONS/NEXT STEPS: 1. Conduct an in-depth assessment to undertsand the prevention needs of adolescents and young people in all their diversity, and especially adolescents who use drugs. This should include carrying out accurate size estimation studies.

2. Identify capacity gaps and implement technical assistance plans quickly, to enable the scale up of combination prevention programmes for all key populations. This should include provision of OST and other services for people in prisons.

3 Create a more enabling environment for marginalised people. This should include implementing programmes that decrease stigma and discrimination, amending laws that criminalise vulnerable people and promoting policies and interventions that protect their human rights.

4 Continue working to increase the accountability of the national HIV prevention response by involving communities in monitoring and evaluation processes.

PEF1860

EVALUATING IMPLEMENTATION PRACTICES IN THE ADOLESCENT TRIALS NETWORK FOR HIV/AIDS INTERVENTIONS (ATN) WITH THE EPIS MODEL: THE ROLE OF POLICY WITHIN PROGRAM IMPLEMENTATION

S.A. Butame[1], G. Harper[2], J. Jauregui[2], S. Skeen[3], A. Idalski Carcone[4], K. Coyle[5], S. Naar[1]
[1]Florida State University, Center for Translational Behavioral Science (CTBScience), Tallahassee, United States, [2]University of Michigan, Health Behavior & Health Education, Ann Arbor, United States, [3]Hunter College, PRIDE Health Research Consortium, New York City, United States, [4]Wayne State University, Family Medicine and Public Health Sciences, Detroit, United States, [5]ETR, Scotts Valley, United States

BACKGROUND: Implementation science encourages the use of models such as the Exploration, Preparation, Implementation, Sustainment (EPIS) model, to characterize the contextual factors that impact the uptake of evidence-based practices (EBPs). For example, in the ATN, the Scale It Up (SIU) program, utilizes EPIS to assess EBP implementation at U.S. sites across. Though EPIS stresses policy at all levels, as critical to implementation, traditional study designs and strategies sometimes omit the influence of policy and may fail to consider the need for policy change as necessary for the sustainment EBPs.

DESCRIPTION: We thus initiated a policy and advocacy working (PAW) group, of researchers, key stakeholders and youth advocates within the ATN. PAW utilizes an implementation science framework to translate youth communities' HIV concerns into potential policy/advocacy solutions, applies mixed methods to determine the most impactful options for policy change, engages policy actors relevant to the proposed policy/advocacy solution, disseminates policy products that are in alignment with the proposed policy solution, and evaluates the enacted solutions as part of a set of implementation strategies.

LESSONS LEARNED: Studies within the ATN, highlight inconsistencies in federal, state and local funding as perennial concerns for care and treatment sites. They characterize policies and legal statutes that impede the ability to reach and engage with sexual and gender minority and at-risk youths. Thirdly, they denote workforce trends and stability, particularly when it comes to paraprofessionals (e.g., community health workers and navigators), as a concern. Our work within PAW is critical to the development of guidelines and agenda-setting processes that can inform programs within the ATN broadly, to better delineate them in the context of EBP implementation and sustainment.

CONCLUSIONS/NEXT STEPS: Findings from PAW and the ATN, identify several social and political factors that affect implementation and sustainment of EBPs focused on reducing risk and promoting resilience among young people. The PAW will evaluate the following policy/advocacy areas for developing new implementation strategies:

1) mandatory workforce development training for developmentally sensitive, stigma-reducing and evidence-based youth HIV-related services;

2) reimbursement for paraprofessionals; and,

3) comprehensive sexuality education sensitive to the needs of at-risk youth.

PEF1861

ENSURING ACCESS TO HIV CARE AND PREVENTION FOR PEOPLE IN IMMIGRATION DETENTION IN THE UK

K. Smithson[1], C. Gowar[1], D. Gold[1]
[1]NAT (National AIDS Trust), London, United Kingdom

BACKGROUND: People held in detention in the UK are entitled to receive the same standard of healthcare that is available in the community, including access to HIV treatment, care and prevention. In addition, Home Office policy on 'Adults at Risk' has specific ramifications for people living with HIV. However, it is known through HIV organisations and clinicians that these standards are not upheld with people regularly not receiving their medication, missing appointments and sometimes being deported without safe access to treatment.

Various developments in HIV treatment guidelines and Home Office policy on treatment of 'vulnerable' adults, meant that previously existing guidance for people held in immigration detention who are living with HIV was out-of-date.

DESCRIPTION: NAT (National AIDS Trust) collaborated with the British HIV Association (BHIVA) to update guidance. The aim was to ensure that healthcare and operational staff in Immigration Removal Centres (IRCs) and Short-term Holding Facilities (STHFs) and staff in HIV clinics local to detention facilities were well-informed regarding new and existing policies and how best to implement them via specific practices and protocols. The guidance also includes a checklist of responsibilities for those working in IRCs, STHFs and HIV clinics.

LESSONS LEARNED: Producing this guidance required collaborating with a range of stakeholders with very different objectives and sometimes directly contradictory positions (NAT opposes the detention of migrants in principle). Early and persistent engagement, along with appeal to formal policy was vital for creating a document that was acceptable for all and therefore likely to be implemented.

Healthcare staff in IRCs need to be able to work within the wider

healthcare system and with those managing IRCs. Formally cementing relationships with HIV clinics, e.g. through protocols, can provide invaluable support.

CONCLUSIONS/NEXT STEPS: The guidance has been disseminated to Immigration Enforcement officials, who have adopted it for training purposes. It has also provided an impetus for HIV clinicians to reach out to IRCs in their area. Unfortunately, there are still cases of poor treatment, but this guidance has been used by legal teams to challenge this, and we continue to liaise with policy officials with the aim of eliminating these instances.

PEF1862

COMMUNITY INVOLVEMENT IN SHAPING A 21ST CENTURY NGO

N. Sparling[1], J. Hirono[1], N. Policek[2]
[1]*HIV Scotland, Edinburgh, United Kingdom,* [2]*University of Cumbria, Carlisle, United Kingdom*

BACKGROUND: HIV Scotland is a Non-Governmental Organisation based in Edinburgh, Scotland. It is an independent policy, advocacy and campaigning organisation that has been at the forefront of Scotland's HIV response since 1994. In 2017, the Scottish Government significantly cut the funding that supported the work of the organisation, and there was a need to reconnect with the wider HIV sector, diversify funding and cement it's future with a unique contribution to the sector.

DESCRIPTION: It is important to engage with partners, people living with and affected by HIV and funders to ensure the organisation continued to add value to Scotland's response to HIV. HIV Scotland organised a roadshow of events that were open to people living with HIV, PrEP users, people at risk of HIV, healthcare professionals, NGOs, and policy makers. The purpose of the consultation events and a subsequent online survey was to reconnect with communities affected by HIV and the wider sector, whilst creating a new strategic vision.

LESSONS LEARNED: 118 individuals from across Scotland have responded to HIV Scotland's Online Strategic Plan Consultation and approximately 94 people have attended 5 road shows across Scotland.

People living with HIV said they wanted an organisation that increased public awareness, challenges stigma and discrimination, and provides training for people who are in direct contact with HIV about U=U and general HIV knowledge. NGO's wanted a unified and collaborative response to the challenges of HIV in Scotland, opportunities to bring the sector together to develop concrete strategies and campaigns, and an extended, national campaign to build public awareness of HIV and U=U.

Strengths were identified as advocacy, influence & knowledge. 65% of respondents said informative was a word that best described the organisation. 4% of respondents said that the organisation wasn't needed anymore.

CONCLUSIONS/NEXT STEPS: A large majority of respondents supported expanding the organisations focus, beyond HIV and beyond Scotland. In March 2019, the organisation published #ZEROHIV - the plan for Scotland to reach zero new HIV transmissions. The next steps are to consider how it can play a part on the global stage to contribute to getting to zero.

PEF1863

HOW POLICY AFFECTS PRACTICE: POLICY BARRIERS TO PROVISION OF HIV BIOMEDICAL PREVENTION SERVICES IN SUB-SAHARAN AFRICA

L. Fitch[1], J. Rodrigues[1], M. Warren[1]
[1]*AVAC, New York, United States*

BACKGROUND: Policies governing HIV prevention product access are critical guardrails that influence the uptake of biomedical HIV prevention options such as oral pre-exposure prophylaxis (PrEP). Policies determine who can access a product, where they access it, and from whom. If not addressed, policy barriers can also limit access to next generation products. Improving the enabling environment for biomedical HIV prevention products can increase their reach and impact.

METHODS: AVAC conducted a desk review of the HIV prevention policy landscape in 8 countries in sub-Saharan Africa. This analysis includes training requirements for provision of PrEP and contraceptives, clinical guidelines, National Strategic Plans for HIV and Sexual and Reproductive Health, and implementation strategies. National policies on age of consent and the criminality of same-sex relationships were also examined. In-depth interviews were conducted with 12 stakeholders from the 8 countries.

RESULTS: Of the 8 countries examined, three countries specified a minimum age of 15 years old to consent to PrEP use; the remaining countries did not clearly indicate age of consent. Contraceptive policies are more flexible, with 7 of 8 countries specifying contraceptives should be made available to any woman of reproductive age, and 1 country with a minimum age of 12 years. Overall, 7 out of 8 countries criminalize same-sex relationships. Finally, 3 countries require that ART and PrEP certified doctors, clinical officers, and nurses prescribe and counsel on PrEP, while 3 require training on PrEP only.

CONCLUSIONS: Policies related to age of consent for PrEP are often not aligned with age of consent policies for sexual intercourse, HIV testing services (HTS) & contraceptives. Aligning age of consent policies for family planning & PrEP may facilitate increased access and integrated service delivery. Implementing task-shifting can increase access to PrEP and facilitate implementation of community-led services for key populations, which reduce stigma, improve service quality and adherence. Removing these barriers can improve the impact of oral PrEP and accelerate introduction of future ARV-based prevention products as they become available.

PEF1864

HOW WELL DEFINED ARE NATIONAL PACKAGES OF HIV SERVICES FOR KEY POPULATIONS? AN ASSESSMENT OF 5 ASIAN COUNTRIES

P. Loh[1], S. Nilanka[2], J.W. de Lind van Wijngaarden[3], J.O. Corciega[4], S. Zayasaikhan[5]
[1]*Australian Federation of AIDS Organisations (AFAO), NSW, Australia,* [2]*FPA Sri Lanka, Colombo, Sri Lanka,* [3]*Independent Affiliation, Bangkok, Thailand,* [4]*LoveYourself Inc., Mandaluyong City, Philippines,* [5]*Youth For Health, Ulaanbatar, Mongolia*

BACKGROUND: While the World Health Organization has outlined the comprehensive package of services which should be available for key populations (KPs) --men who have sex with men (MSM), people who inject drugs (PWID), sex workers (SW), transgender people (TG), and prisoners)--these populations rarely have access to the full range of recommended services. We reviewed the existing package

of HIV services for KPs in 6 countries implementing Sustainability of HIV Services for Key Populations in Asia (SKPA). a 3-year Global Fund MCG program led by the Australian Federation of AIDS Organizations (AFAO).

METHODS: Between August 2019-January 2020, we conducted reviews of the National Package of HIV-services for KPs in Mongolia, Lao-PDR, Bhutan, Sri Lanka, and Philippines. Information was extracted through document reviews, KII, FGDS, facility observations, and stakeholder consultations. Interview guides were developed to gather inputs on KP service needs and preferences. A checklist was developed to assess the quality and accessibility of HIV service facilities for KPs.

RESULTS: HIV-service packages for KPs are often not clearly defined. No standards exist for community-led HIV interventions or on how community-services should cooperate and interlink with the government-led health system. Interventions for KPS tend to focus on MSM and female SW and focus mainly on HIV-prevention education, condom provision and promoting HIV-testing services. Little information was found about the situation of PWID, TG, and prisoners. Community-led HIV case-management was either absent or not functioning well, with some notable exceptions (Philippines). Structural interventions and activities to overcome barriers to service uptake (e.g., S&D, social exclusion, criminalization, etc.) – were lacking or did not exist.

CONCLUSIONS: Before HIV-services for KPs can be scaled up, a defined package of HIV-services must be agreed upon. Clearly defined standards for implementation should be developed in which the roles and procedures of community-led HIV-services and government-led services are stipulated. PrEP/PEP should be added to the HIV-service package for KPs and HIV-testing services should be made more diversified by including community-based, lay-person-initiated HIV-testing, and HIV self-testing. S&D and other barriers to accessing services for KPs should be addressed through trainings and sensitizations of healthcare workers and strengthening of mechanisms for KP legal support and protection.

POLICIES ADDRESSING SOCIAL AND ECONOMIC DETERMINANTS OF VULNERABILITY

PEF1865

THE ANTI-GAY LAW: ITS IMPACT AND CONSEQUENCES ON HUMAN IMMUNODEFICIENCY VIRUS PREVENTION IN NIGERIA. A QUALITATIVE STUDY OF MSM COMMUNITY ON HUMANITARIAN PROTECTION IN UNITED KINGDOM

I. Granville[1]
[1]University of East London, Public Health, London, United Kingdom

BACKGROUND: The Nigerian Same Sex Marriages Prohibition Act (SSMPA) (2013) criminalises same-sex relationships or unions and any open support for such unions or groups. Vu et al (2013) suggests that due to the criminalisation of the Lesbian, gay, bisexual and transgender (LGBT) community in Nigeria, a large population of those affected are reluctant to attend sexual health clinics due to stigmatization, discrimination and homophobic comments from people which potentially increase their vulnerability to HIV/Aids. However, there seems to be limited non-ecological data or prospective data which has assessed the impact of the SSMPA (2013) against the MSM with regards to possible health outcomes (Schwartz et al, 2015).

METHODS: This is a qualitative study and eight (8) participants were interviewed from both House of Rainbow Church UK and the United Kingdom Lesbians and Gays Immigration group (UKLGIG). Data was also analysed using Interpretative Phenomenological Analysis (IPA) to explore findings.

RESULTS: The common sub themes that emerged during interviews includes; Far Reaching Consequences, Religion, Culture and Morals, Societal Expectations, Healthcare Systems and Mental Health Crisis. This was subsequently grouped in three (3) main key themes which includes: Ethical Reflections, Psychological Reflections and Social Systems Reflections. These three themes were analysed in line with the findings of this research study.

CONCLUSIONS: Evidence from this research highlights inequalities in Public health policies in Nigeria. The need for a more holistic approach was clearly elaborated. The need to educate Nigerians on how genetics determines an individual's sexual preference was discussed bearing in mind that Nigeria is a multicultural society with deeply rooted moral and religious values.

PEF1866

HOUSING STATUS AND HIV VIRAL LOAD SUPPRESSION AMONG ALAMEDA COUNTY RYAN WHITE CLIENTS

D. Theodore[1], E. Arnold[2], W. Steward[2], N. Moss[3], J.P. Smith[1], California HIV/AIDS Research Policy Fellows Program
[1]Alameda County Public Health Department, Office of HIV Care, Oakland, United States, [2]University of California San Francisco, Division of Prevention Science, San Francisco, United States, [3]Alameda County Public Health Department, HIV/STD Section, Oakland, United States

BACKGROUND: California's housing crisis is a challenge to HIV public health. In Alameda County (AC), homelessness increased 43% since 2017. Five percent of homeless individuals reported HIV as a health condition, yet HIV prevalence in AC is only 0.4%. Low-income people living with HIV (PLWH) in AC can receive HIV-related services through the Federal Ryan White HIV/AIDS Program (RWHAP). We evaluated the relationship between housing status and viral load suppression (VLS) among AC RWHAP clients.

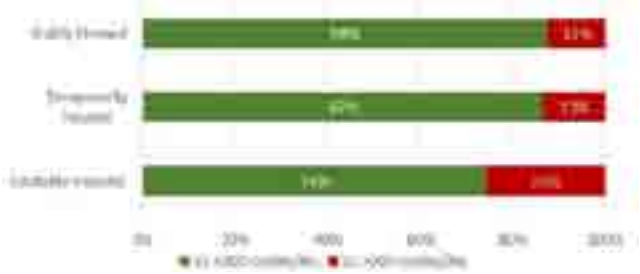
METHODS: Data on housing status, service category and viral load was extracted from the RWHAP AIDS Regional Information Evaluation System (ARIES) for 2018. VLS (≤200 copies/mL) was compared for clients stably (SH), temporarily (TH) and unstably (UH) housed, as reported by service providers. A X^2 test was performed to evaluate association between VLS and housing status.

RESULTS: In 2018, 964 AC RWHAP clients had housing information reported in ARIES. VLS was reported in 85% of SH, 82% of TH, and 71% of UH clients (X^2=5.22, p=0.74, figure 1).

[Figure 1. Viral suppression rate and housing status for RWHAP clients in Alameda county. N=964 X^2= 5.22, p=0.74]

Among medical case management (MCM) clients, 86% of SH, 87% of TH and 73% of UH clients achieved VS (X^2=6.125; p=0.045). Overall VLS was 85.2% for outpatient ambulatory (OA) clients, but the numbers of TH and UH clients were too small to test for significance.

CONCLUSIONS: There is suggestive evidence of a dose-dependent relationship between VLS and housing status. MCM clients were more likely than OA clients to be unstably housed. Association between VLS and housing for clients receiving MCM was significant (Figure 2).



[Figure 2. Viral load suppression rate and housing for RWHAP MCM clients in Alameda county. N=510 X^2= 6.125, p=0.045]

MCM is designed for those facing engagement in care challenges, despite this, disparate VLS outcomes remain for UH clients. There is a benefit to receiving services through the RWHAP network. RWHAP providers take a client-centered approach.

By incorporating homeless outreach and street-level services, this approach can be expanded to better serve a highly vulnerable population.

PEF1867

CHALLENGES IN ENDORSING TRANSGENDER RIGHTS BILL AS LAW IN INDIA

A. Prajapati[1], Y. Singh[2], V.R. Anand[2], S. Gupta[2]
[1]The Humsafar Trust, Human Rights, Delhi, India, [2]The Humsafar Trust, New Delhi, India

BACKGROUND: Supreme court of India have passed a judgement in year 2014, endorsing self- confirmation of gender identity. Further, Transgender person bill was passed by Indian parliament and endorsed as a law.

DESCRIPTION: The Transgender person bill passed by the Indian parliament has numerous provisions for Transgender community. Provision includes skills development and employment; social security and healthcare; legal and financial aid; prevention of abuse, violence or exploitation; and social inclusion. Many CBOs led by Transgender community and Transgender activists felt that the said bill violates the rights of Transgender community.

The Humsafar Trust, through its initiatives had organized national-level consultations with Transgender led CBOs and Transgender activists to discuss the provisions in the bill. From this consultation meeting, recommendations from the participants were gathered and submitted to the Honorable Ministry of Social Justice and Empowerment for rewriting the bill.

LESSONS LEARNED: Involving CBOs led by Transgender community and Transgender activists in making decision is key to ensure community-sensitive and effective policies. Using public action and civil society consultations, the campaign pressed the Indian government to recall key provisions in the bill and also to enact it as a law at the earliest.

CONCLUSIONS/NEXT STEPS: Within the Transgender community there are differences in opinions about retaining certain provisions. Further community and stakeholder consultations may help in achieving a consensus and result and ensure in effective implementation of the said bill

PEF1868

YIELDING RESULTS THROUGH HIV SENSITIVE SOCIAL PROTECTION IN SUDAN

E. Abdelraheem[1]
[1]UNDP, HIV, Health and Development, Istanbul, Turkey

BACKGROUND: In Sudan, out of the 6000 members of the Sudanese living with HIV Care Association (SPCA) who are on treatment, only 27% have access to Social Health Insurance (SHI), 99% are below the national poverty line (USD 1.45 per day) and 75% of them are unemployed. While the country has structured Social Protection System, cash transfers and Social health Insurance (SHI). UNDP aimed to influence the social protection systems in the country to be more inclusive of PLHIV and address the factors that hinder their access to these publicly available social protection services.

DESCRIPTION: During 2018, In partnership with SPCA, UNDP designed and implemented a tailored quantitative and qualitative research that provided the full socioeconomic profile of PLHIV and mapped the social protection systems and schemes in the country. A national validation and advocacy workshop was conducted in the presence of Ministers of Health and Social Welfare, where the findings of the study and the preliminary recommendations were presented. As immediate reaction, the minister of social welfare pledged to cover all of PLHIV who are on ART treatment with Social Health Insurance and other services. A joint committee developed some guidelines and SOPs to address the bottlenecks that hinders PLHIV access to SHI and other services and SPCA started enrolling their members. By the end of 2019, around 4000 were already enrolled and received their SHI cards.

LESSONS LEARNED: With targeted advocacy and evidence-informed policy work, the PLHIV access to SHI and other Social protection services increased from 27% to 75%. It is important to carefully analyze and leverage the potential resources and services that are outside the health sector for better health equality and HIV results. Overall, policy work is slow to demonstrate results, but these results are more sustainable.

CONCLUSIONS/NEXT STEPS: Given this important break through, the efforts will continue first to sustain this initiative through developing an HIV Sensitive Social Protection Strategy within the Ministry of Social Welfare, including some key steps for inclusion of PLHIV and key populations in the broader national social protection and social policy strategic framework which is being developed.

PEF1869

SÃO PAULO PREPARED IN ALL REGIONS FOR MORE VULNERABLE AND PRIORITIZED POPULATIONS AGAINST HIV EPIDEMICS IN BRAZIL

A. Queiroz da Silva[1], M. Cristina Abbate[1], E. Maria Ferreira Alves[1], A. Gomes de Lorena[1], M. Cristina dos Santos[1], S. Menin Rodrigues[1], L. Pinheiros[1]
[1]Municipal Program of STD/AIDS, Municipal Health Secretaria, São Paulo, Brazil

BACKGROUND: HIV/AIDS virus infection in the city of São Paulo, follows the national tendency, marked by the segments which are more exposed to HIV /AIDS virus such as homosexuals and other men who have sex with other men, transgender people, sex workers, and people who use drugs, which involves great complexity related to social exclusion and various violations of rights.
DESCRIPTION: Through the previously conducted research, it was found that PrEP was accessed, mostly, by non Public Health System (also known as SUS) dependent white gay men with a high level of education. Thus, the Municipal Program of STD/Aids decided to first implement in services, from the Municipal Network Specialized in STIs/AIDS, further away from the city center and, in a pioneering way, also in Testing and Counseling Centers. There was training of the teams and relocation of medical professionals to expand the supply. Dissemination on social networks, production of promotion material, provision of said materials to prevention agents and partnership with social spaces of listed populations.
LESSONS LEARNED: Until December 2019, out of the 26 specialized services, 24 had already offered this prophylaxis, with more than 4000 people registered in PrEP use, 41% of which are black. More than 200 preventive agents have a good knowledge on how to approach the more exposed population and are increasingly promoting prophylaxis. The network of partners, such as saunas, bars, nightclubs and sex parties, is aware of the new prevention strategy and has disseminated our materials and even produced their own with the technical assistance of the Municipal Program.
CONCLUSIONS/NEXT STEPS: To maintain and to transversally expand PrEP's access to the most vulnerable populations and priority (black, young and etc.), it is necessary to expand dissemination in extramural activities in sociability and entertainment environments. Peer education work is also critical to increase knowledge about combined prevention and promote rapprochement with health services.

PEF1870

SEX-POSITIVITY IN PUBLIC HEALTH STRATEGIES AND MEDICAL CONSULTING

O. El Omrani[1], E. Janušonytė[2], L. Lalucat[3]
[1]Ain Shams University, Faculty of Medicine, Cairo, Egypt, [2]Vilnius University, Faculty of Medicine, Vilnius, Lithuania, [3]Universitat de Barcelona, Faculty of Medicine, Barcelona, Spain

BACKGROUND: The International Federation of Medical Students Association (IFMSA) has been advocating towards Sexual and Reproductive Health and Rights, voicing the opinion of 1.3 million medical students from 128 countries. IFMSA acknowledges the urgency of the global HIV and AIDS pandemic and need for a multi-sectoral response to improve healthcare access and outcomes of people living with HIV. IFMSA aims to equip medical students with the skills to advocate for reducing and challenging discrimination related to HIV and AIDS in healthcare and education settings.
DESCRIPTION: We first formulated a gender and regionally-represented Working Group to develop a Policy Document on HIV and AIDS response with calls on key stakeholders as governments, NGOs, healthcare providers, educational institutions and students, supported by the necessary literature. IFMSA then designed a capacity-building workshop, HIV Education and Advocacy Training (H.E.A.T), in Lithuania to discuss the concept of sex-positivity, targeting medical and non-medical students. Sex-positivity is a broader concept used in different areas of sexuality education. For the social determinants of HIV, the concept is very relevant for increasing access to prevention and testing and reduce stigma. The workshop was conducted again in Montreal and empowered participants from different countries to fight the discrimination related to HIV and AIDS.
LESSONS LEARNED: The policy document was adopted by our 136 member organizations to represent the stance of our federation and to be utilized on a global, national and local level. A policy brief is currently being developed for our attendance to the Commission on Status of Women (CSW64).
The H.E.A.T workshop was developed to consist of:
- Risk-based vs sex-positive approach -explanation of concepts and approach in medical schools.
- Benefits of sex-positive approach in prevention, counseling and sexuality education - brainstorm the ideas of the positive impact of sex-positive approach in HIV related education;
- Take-home messages and feedback.
CONCLUSIONS/NEXT STEPS: We plan to expand the conduction of H.E.A.T workshop to regional and local execution to deepen the understanding of medical students of the sociocultural issues relating to HIV and AIDS. We are now preparing for the next H.E.A.T workshops in Peru and France. We will also ensure the continuous evaluation of each workshop conducted.

PEF1871

LEGAL AND POLICY REVIEW ON LGBTIQ PEOPLE'S ACCESS TO HIV, HEALTH AND SOCIAL PROTECTION SERVICES IN CAMBODIA

C. Phorng[1], P. Ung[2], K. Nakagawa[3], S.C. Choub[1]
[1]Khmer HIV/AIDS NGO Alliance (KHANA), HIV, TB and Public Health, Phnom Penh, Cambodia, [2]UNAIDS Cambodia, HIV and AIDS, Phnom Penh, Cambodia, [3]Freelance Consultant, Independent Consultancy, Phnom Penh, Cambodia

BACKGROUND: LGBTIQI people are not explicitly protected by the Cambodian Law and no defined sanctions for those who commit abuse against them. Limited Legal and social systems for protecting LGBTIQI people could prevent them from accessing HIV, health and social protection as needed. The Legal and Policy Review was conducted at aiming to identify legal and policy barriers hindering LGBTIQ people from accessing HIV, health and social protection services.
DESCRIPTION: The assessment consisted of two parts including desk review of Cambodian laws and policies and key Informant Interviews with LGBTIQ people, government Officials of relevant ministries, relevant CSOs and UN agencies, and service providers. In total, 10 national laws and 11 policies were reviewed and 84 people were interviewed, including 59 LGBT people. The analysis from desk review of Cambodian law and policy confirmed the no explicit/direct discriminatory provision in Cambodian law/policy towards LGBT people, a notable barrier is Art. 19 of HIV law not intentionally targeted LGBT people, and the current legal system does not include any legislation that proactively supports transgender people's right

to be legally recognized according to their self-defined gender. The key findings from field interview were confirmed very limited knowledge on social protection by LGBTIQ people, limited understanding about SOGIE amongst health service providers, previous experience of discrimination prevents them to access to health service, and mental health care due to stigma and experience of social exclusion, isolation or discrimination is serious concern.

LESSONS LEARNED: The key barriers associated to law and policy have been identified that prevent LGBTIQ people from accessing HIV, health, and social protection services. The barriers include limited dissemination of information about social protection framework, lack of LGBTIQ friendly-services at health facilities, and limited professional skills and understanding of SOGIE by health service providers.

CONCLUSIONS/NEXT STEPS: Based on analysis of the identified barriers, the policy brief was developed which is the advocate tool with government institutions and key stakeholders through dissemination workshop and policy dialogue. The specific recommendations were identified to inform the national interventions on HIV and health services , social protection: law and policy reform, and research and campaign focused on HIV and SOGIE.

POLICIES ADDRESSING HIV IN THE WORKPLACE AND/OR EDUCATIONAL INSTITUTIONS

PEF1872

TEACHERS' PERCEPTION AND ATTITUDE TOWARDS SCHOOL-BASED SEXUALITY AND HIV/AIDS PREVENTION EDUCATION IN IBADAN NORTH LOCAL GOVERNMENT AREA, OYO STATE, NIGERIA

I. Olufadewa[1,2], O. Arulogun[1], O. Roberts[1]
[1]University of Ibadan, College of Medicine, Ibadan, Nigeria, [2]Slum and Rural Health Initiative, Research Academy, Ibadan, Nigeria

BACKGROUND: Despite the introduction of the Family Life and Health Education (HIV Prevention Education) Programme in secondary schools since 2003, studies have found that the percentage of young women and young men in Nigeria who have comprehensive knowledge about HIV/AIDS is still abysmally low at 24% and 34% respectively. This study assessed the perception, attitude, and preparedness of secondary school teachers who are the major stakeholder of Nigeria's school-based sexuality and HIV prevention education program in secondary schools.

METHODS: A descriptive cross-sectional design using a stratified random sampling method was employed to select participating schools. A total of 373 secondary school teachers from twenty schools in Ibadan North Local Government Area participated by completing a self-administered questionnaire. The data were analyzed using descriptive and inferential statistics. Ethical approval was obtained from relevant authorities.

RESULTS: More than half, 54% of the teachers indicated that sexuality education is best taught by parents and 55% of them believed the home is the best place to teach on human sexuality/HIV/AIDS. Only 35.4% of the 373 respondents suggested that HIV prevention education should be introduced to primary school students (usually less than 10 years). Also, 69.7% of the respondents reported to have no formal training on sexuality education and almost one out of every four (23%) had difficulties in teaching about Sexual Coercion and Abuse. This study found that gender and previous training on sexuality education were statistically significant factors that were associated with their perception. Furthermore, the female gender was a statistically significant factor that was associated with a better attitude of teachers towards sexuality education (p=0.019), while a higher educational degree (p=0.010) was associated with better comfort level. Challenges that affected teachers' delivery of HIV prevention education included inadequate training, inadequate teaching materials, inadequate support from school and parents.

CONCLUSIONS: Overall, findings from this study provide evidence that teachers have a poor perception of their roles, a somewhat good comfort level and a better attitude towards the school-based HIV prevention education program. This study re-emphasizes that pre- and in-service training programs for teachers' are needed to develop their competence, confidence, and commitment to teaching on HIV/AIDS.

PEF1873

ENSURING AN EQUITABLE AND JUSTICE WORKFORCE FOR WORKERS OF COLOR LIVING WITH HIV

L.H. Scruggs[1], V. Johnson[2]
[1]Ribbon Consulting Group, Largo, United States, [2]Ribbon Consulting Group, LLC, Washington, United States

BACKGROUND: The Federal Plan to End the HIV Epidemic (EHE) in America provides many new opportunities and challenges in response to the epidemic. As one of its goals, the EHE seeks to prepare a modern HIV workforce that is needed to reach the nearly 500,000 persons out of HIV care and the 1M persons that are eligible for PrEP. This policy and human rights discussion are vital to ensure that people living with HIV are participating meaningfully within the HIV workforce.

DESCRIPTION: Peers - people living with HIV - can be found in nearly every position within the HIV field. The purpose of this session is to focus on those positions which are heavily occupied by peers such as frontline staff, outreach workers, case managers, prevention educators, patient navigators, peer leaders, and program managers working in HIV prevention and care. This vital policy discussion centers around efforts to ensure that peers working in client-centered positions are appropriately trained and supported to be hired, retained, and elevated. One initiative is the creation of a Leadership Twinning Net as one demonstration of a commitment to ensure meaningful involvement of peers across the workforce.

LESSONS LEARNED: The US HIV community has taken several steps to pave the way for a workforce. These steps re-affirm, support, and value the skills, lived experiences, and contributions people living with HIV bring to the HIV workforce. For example, a) the issuance of a stigma-free language guide, b) the inclusion of "lived experiences" as a representation of academic achievement or work experience when determining eligibility for job positions, c) funding support for professional development, and opportunities for organizations to transform to trauma-informed, healing justice organizations.

CONCLUSIONS/NEXT STEPS: EHE requires extensive workforce development initiatives to achieve its goals and objectives. Therefore, it is essential to discuss the roles peers are playing and will play in this rapidly shifting and transforming social and political environment. A thoughtful discussion with global leaders interested in workforce development will have future implications for lessons learned, best

practices, and innovative initiatives for developing a responsive workforce as reflected in the inclusion of peers in meaningful, sustainable, and living-wage positions.

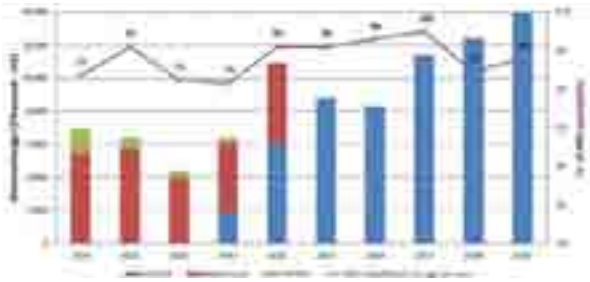
POLICIES RELATED TO TREATMENT ACCESS (INCLUDING INTELLECTUAL PROPERTY POLICY)

PEF1874

RAPID ARV STOCKOUT ASSESSMENT PREVENTED MAJOR HEALTH AND POLITICAL CRISIS IN THE DOMINICAN REPUBLIC

C. Valdez[1], E. Barillas[2], H. Espinoza[3], B. Betances[4], J.J. Elenes[5], G. Sosa[5]
[1]GIS Grupo Consultor EIRL, Medicines, Santo Domingo, Dominican Republic, [2]GIS Grupo Consultor EIRL, Medicines, Washington, United States, [3]GIS Grupo Consultor EIRL, Medicines, Lima, Peru, [4]UNAIDS, Country Director, Santo Domingo, Dominican Republic, [5]USAID, Health, Santo Domingo, Dominican Republic

BACKGROUND: Due to the implementation of an efficient pharmaceutical supply system (known as SUGEMI), the selection of efficient international providers and the allocation of the government budget, the Dominican Republic (DR) had not to experience stock-outs of antiretrovirals (ARV) from early 2014 until October 2018 (Figure 1). In November 2018 persons living with HIV initiated a mass media campaign to denounce stock-outs of important ARVs. The SUGEMI information system confirmed the situation.



[Figure 1. Allocated budget for ARV and HIV supplies 2010 to 2019
Source: "Valdez, C; Barillas E. (2018) Update of SIAPS Project funding by USAID. Programación de VIH del Sistema Unico de Gestión de Medicamentos e Insumos (SUGEMI)".]

DESCRIPTION: USAID and ONUSIDA commissioned GIS to carry out a rapid assessment to identify the origin of the stock-outs. The study methodology included analysis of the SUGEMI database, review of the requisition and dispatch formularies and interviews with key informants at different levels of the logistic chain. Three ARVs were out of stock in all the supply chain due to lengthy exchanges during the procurement process among the Ministry of Health (MoH), Ministry of Finance, the procurement agency, and other public players. Other ARVs were out of stock in health facilities due to the lack of adherence to requisition and dispatch standards procedures

LESSONS LEARNED: The results were presented to the Minister of Health, who ordered -though a Ministerial Decree- the direct procurement of ARVs by the MoH, saving at least 8 months in the procurement process. Based on the study results, the cooperating agencies and the MoH have committed resources to strengthen the adherence to the SUGEMI standards operative procedures, monitoring annual procurement, designed of a standard form for people with HIV can alert and inform about potentials stock-outs to the authorities at facility level. As of April 2019, the stock-out crisis was over

CONCLUSIONS/NEXT STEPS: Timely rapid assessment results based on evidence can contribute to key decision-makers to avoid major public health problems, the political crisis and identify interventions to increase access to ARVs and prevent future stock-outs

PEF1875

MORE FOR LESS: SHOULD INTELLECTUAL PROPERTY RELATED INTERVENTIONS BE FUNDED BY THE GLOBAL FUND?

M. Ahmar[1], D. Peeler[1], S. Kondratyuk[2], O. Mellouk[1], W. Jallow[3]
[1]International Treatment Preparedness Coalition (ITPC), Casablanca, Morocco, [2]International Treatment Preparedness Coalition (ITPC), Kiev, Ukraine, [3]International Treatment Preparedness Coalition (ITPC), Gaborone, Botswana

BACKGROUND: Middle-Income Countries (MICs) are home to the majority of HIV-positive people and highest burden of TB/HIV coinfection, yet they are often excluded from mechanisms enabling access to generic medicines and facing funding cuts from multilateral organizations including the Global Fund. Recognizing such trends are impacting MICs sustainable access to life-saving medicines, ITPC has conducted analyses to determine whether interventions aiming to remove intellectual property (IP) barriers for access to affordable generics were within the scope of the GFATM and how to encourage funding for such interventions in MICs.

DESCRIPTION: ITPC conducted a desk review to assess whether IP and access to affordable medicines related interventions were within the Global Fund scope. ITPC also conducted research among civil society and communities in 15 middle-income countries from latin America, Africa, Eastern Europe and Central Asia and Southeast Asia to determine their main challenges in accessing funding for IP related interventions. Finally, discussions with GFATM Secretariat and Board members on policies and attitudes towards IP and access to medicines were held.

LESSONS LEARNED: The analysis concluded IP and access to affordable medicines was within the GFATM's scope and mentioned in no less than 10 policy documents issued between 2015 and 2019. Yet the interviews with communities from MICs evidenced that IP related interventions were seldom funded by the Global Fund and facing a general defunding trend. Finally, discussions with GFATM stakeholders highlighted reluctance from the institution regarding support to IP related interventions despite it being part of its scope.

CONCLUSIONS/NEXT STEPS: The analysis conducted showed the need for interventions to tackle IP barriers to be encouraged in the next GFATM funding cycle, particularly in MICs facing access to medicines challenges in a way to ensure sustainability. The reasons for such interventions being seldom funded vary from non-inclusion from countries to deprioritization or pressures for removal from the GFATM. To overcome these obstacles, ITPC is conducting advocacy work at national level for countries to be informed on the possibility for IP to be funded by the GFATM and empowered to include IP interventions in grants, and for the GFATM to support and fund IP related activities in country grants.

PEF1876

ENSURING HIV TREATMENT SUSTAINABILITY AND PROCUREMENTS OF SOCIAL CARE SERVICES FROM REALLOCATED STATE FUNDS THROUGH OPTIMIZATION OF TREATMENT REGIMENS: EXPERIENCE OF SCALING UP OF GENERIC DOLUTEGRAVIR ACCESS IN UKRAINE

Z. Zamikhovska[1], S. Dmytriiev[1], Y. Kononchuk[1]
[1]*All Ukrainian Network of People Living with HIV, Kyiv, Ukraine*

BACKGROUND: Ukraine has remained country with the second-largest HIV burden in Eastern Europe and Central Asia (as of 2019, 244000 people living with HIV/AIDS (PLWHA)). Considering scale of the epidemics and international obligations to complete transition from donor to state HIV-programme funding by 2020 Ukraine was forced to review its state policy on treatment regimen towards effective but cost-affordable medicines. Since 2016 the World Health Organization (WHO) recommended dolutegravir (DTG) as the alternative first-line treatment. Until 2016, DTG was under patent protection in Ukraine.

DESCRIPTION: In 2016 All Ukrainian Network of People Living with HIV elaborated and supported Ministry of Health of Ukraine (MoH) in piloting advocacy strategy on extension of HIV treatment coverage through advocating access to generic DTG to the Ukrainian market. Key components of the 2016-2019 advocacy strategy include:

(1) Negotiations with originator manufacturer and Medicine Patent Pool on voluntary license on DTG within 2014-2016;

(2) Advocacy on DTG inclusion to the state medicine procurement list in 2017;

(3) Negotiations with MoH officials on registration of generic DTG in 2017;

(4) Advocacy on DTG procurement policy as the main HIV first-line treatment within 2017-2019 by introducing calculations on progressive annual basis;

(5) Advocacy on adoption of latest WHO HIV treatment guidelines with updated recommendations stating DTG as the main first-line and second-line treatment in 2018-2019.

LESSONS LEARNED: Project shows that in case of limited state budget resources sustainability of HIV programmes may be achieved through the generic substitution. It secures universal HIV treatment coverage and simultaneously enables coverage of social care services needs from the reallocated state funds. Collaboration between state officials and community advocators is critical for achieving state policy amendments in best patients interests.

CONCLUSIONS/NEXT STEPS: Budget funds saved as a result of optimized treatment regimens secure safe transition to the state funding of HIV programmes ensuring HIV treatment sustainability. In 2019 reallocated from the savings 4,5 million USD were used to cover procurements of social care services for PLWHA solely from the state funds for the first time. In 2020 amount is expected to scale up to 8,5 million USD due to the continuation of treatment regimens optimization.

POLICY ANALYSIS AND INDICATORS OF POLICY EFFECTIVENESS

PEF1877

ANALYSIS OF HIV-RELATED LAWS AND POLICIES IN 23 COUNTRIES IN LATIN AMERICA AND THE CARIBBEAN: "MIRA QUE TE MIRO"

R. Baruch[1], L. Malajovich[1]
[1]*International Planned Parenthood Federation, Western Hemisphere Region, Mexico City, Mexico*

BACKGROUND: In 2013, all countries in Latin America and the Caribbean (LAC) signed the Montevideo Consensus, the strongest UN document on sexual and reproductive health and rights (SRHR), which included a robust commitment on HIV prevention and care. In order to analyze the progress on the implementation of those commitments, 8 regional civil society networks, developed a tool to score the level of implementation of laws and policies related to 13 SRHR-related topics, including HIV and aids. The tool is called "Mira Que Te Miro" and is based on an online digital platform.

METHODS: A desk review was carried out during 2017 from 23 countries in LAC in order to identify laws, policies, budget and legal barriers on HIV according to the tool that was developed based on the recommendations from WHO, UNAIDS and other multilateral institutions. The second phase was made of interviews and expert consultations were organized in order to validate the results from the desk review. A standardized score was assigned to the answers and quality of laws and policies in all countries.

RESULTS: Among the 13 SRHR-related issues analyzed, "HIV and aids" was at the top of the list as the issue with the highest score, 76/100 in comparison with other such as SRH (71/100) or Sexuality education (47/100). Four countries have a score of more than 90%, meaning that they have a very high degree of legislation and policies that reach international standards: Cuba, Paraguay, Jamaica and Brazil. Some aspects that all countries achieved are: Having a national strategy for HIV prevention and treatment and having a strategy for prevention of vertical transmission. The weakest aspects were: having laws that criminalize HIV transmission and not having mechanisms to create formal complaints of discrimination.

CONCLUSIONS: All countries in LAC have laws and regulations regarding HIV, but not all of them are up to the highest standards that multilateral organizations recommend. Laws and policies related to human rights were the weakest ones and therefore, there is a need to improve them in order to ensure that people living with HIV and key populations are protected against discrimination and violence.

PEF1878

ENDING THE EPIDEMIC STRATEGIES IN DIFFERENT REGIONS OF THE UNITED STATES: PROGRESS AND DEEPER CHALLENGES AT THE LAUNCH OF THE UNITED STATES ENDING THE HIV EPIDEMIC (USEHE) INITIATIVE

D. Daskalakis[1], K. Hagos[2], N. Moss[3], T. Packer[4], S. Hyman[4], M. Perez[5], O. Blackstock[6], M. Ramos[7], J. Morne[2]
[1]New York City Department of Health and Mental Hygiene, Disease Control, Queens, United States, [2]New York State Department of Health, AIDS Institute, Albany, United States, [3]Alameda County Public Health Department, Alameda County, United States, [4]San Francisco Department of Public Health, San Francisco, United States, [5]Los Angeles County Department of Public Health, Los Angeles, United States, [6]NYC Department of Health and Mental Hygiene, Disease Control, Queens, United States, [7]California Department of Health, Sacramento, United States

BACKGROUND: New York State/New York City (NYS/NYC) and California/Alameda County/San Francisco/Los Angeles (CA/AC/SF/LA) have each launched regional strategies to end their HIV epidemics (RS2EHE). Although the process and timelines of these RS2EHE differ, progress toward their respective RS2EHE goals is being achieved. Persistent and deep equity-related issues continue to require evaluation and re-calibration of RS2EHE goals and programs to bring the HIV epidemic into better, more equitable, and lasting control.

DESCRIPTION: NYS/NYC and CA/AC/SF/LA are achieving many of their RS2EHE goals with their respective key indicators demonstrating significant improvement as well as persistent disparities.

- NYS/NYC and CA/AC/SF/LA have all prioritized implementation of Pre-Exposure Prophylaxis, decreasing the number of people living with HIV unaware of their status, retention in care/ viral suppression, and addressing stigma as core approaches in their RS2EHE.
- Both groups of jurisdictions have experienced significant decreases in new HIV diagnoses and estimated incident infections--rates remain highest in Black, Latinx, and transgender people.
- Overall viral suppression and time from diagnosis to viral suppression continue to improve in these jurisdictions; these improvements continue to vary by race, age, gender identity, and HIV risk factor.
- Progress on some indicators are more pronounced in urban settings than in in other parts of CA and NY.

LESSONS LEARNED: RS2EHE have greatly accelerated control of the HIV epidemic in two of the most populous states in the US. However, important racial/ethnic, HIV risk factor, gender, and age disparities persist and may be further heightened by other social determinants of health as overall RS2EHE goals are being achieved. Programs and other strategies that address disparities among Black and Latinx people, transgender people, people who inject drugs, youth, and older adults must be consistently evaluated using an equity lens and re-calibrated to achieve regional and USEHE goals without creating deeper disparity.

CONCLUSIONS/NEXT STEPS: HIV will not easily disappear from NYS/NYC or CA/AC/SF/LA, even with RS2EHE or the USEHE initiative. Lessons learned from RS2EHE are critical for success and demonstrate the need to innovate to more completely address equity as we bring HIV into better control across jurisdictions.

PEF1879

IMPACT OF THE HIV UNIVERSAL TEST AND TREAT STRATEGY ON ANTIRETROVIRAL TREATMENT UPTAKE AND RETENTION IN THREE CAMEROON HIV CLINICS

A. Rogers[1], D. Anastase[2], E. Halle[1], E. Thomas[1], A. Adedimeji[3], A. Jules[1]
[1]University of Buea, Buea, Cameroon, [2]Clinical Research Education Network and Consultancy, Douala, Cameroon, [3]Albert Einstein College of Medicine, New York City, United States

BACKGROUND: Success of the human immunodeficiency virus (HIV) test-and-treat (T&T) strategy requires high antiretroviral (ART) uptake and retention. However, low ART uptake and retention continue to be reported in ART programs. This study assessed ART uptake and retention outcomes of the HIV T&T strategy in three HIV clinics in Cameroon.

METHODS: A retrospective chart review was done for 423 patients who initiated HIV care within a period of three months prior to the implementation of the HIV T&T strategy, and for another 423 patients who initiated HIV care within a three-month period following the HIV T&T strategy implementation. For each group, sociodemographic, ART uptake and retention data were collected. Chi square and Student T tests were used to test for differences proportions and means between the two groups at $p<0.05$ and 95% confidence interval.

RESULTS: The mean ages (years) in the pre-T&T and the T&T groups were 39.73 and 39.72, and the proportion of female were 65.85% and 65.08% respectively. ART uptake proportion was higher amongst those enrolled under the T&T strategy (98.08% vs 95.39%, p=0.02). A greater proportion of the patients in the T&T group initiated ART within 2 weeks following HIV diagnosis (55.84% vs 48.17%, p=0.03). However, ART retention at 24th month was lower in the T&T group (78.83% vs. 85.79%, p=0.01).

CONCLUSIONS: The findings suggest that the T&T strategy is associated with higher ART uptake, earlier ART initiation, and lower ART retention. This underscores a need for strategies to improve ART retention under the HIV T&T guidelines.

PEF1880

PROTECTING LIFE IN GLOBAL HEALTH ASSISTANCE IMPACT ON PEPFAR'S DREAMS PARTNERSHIP

B. Cooper[1], B. Roose-Snyder[2], S. Luffy[1], K. Segal[3], C. Mavodza[4], Z. Bulls[5]
[1]CHANGE, Policy Research, Washington, United States, [2]CHANGE, Public Policy, Washington, United States, [3]AVAC, Policy, Data & Analytics, New York, United States, [4]London School of Hygiene and Tropical Medicine, Biomedical Research and Training Institute, Harare, Zimbabwe, [5]CHANGE, Policy Advocacy, Washington, United States

BACKGROUND: Protecting Life in Global Health Assistance (PLGHA) is a U.S. policy that prohibits foreign non-governmental organizations that receive global health assistance from using their own, non-U.S. funds to advocate for the liberalization of abortion laws or provide abortion services, counseling or referrals, except in cases of rape, incest, and life endangerment of the pregnant woman.
DREAMS is a successful PEPFAR public-private partnership with the goal of reducing new HIV infections among AGYW. Since the policy applies to all U.S. global health assistance, including PEPFAR, PLGHA has the potential to harm the success of DREAMS by derailing health systems, referral networks, and advocacy structures.

METHODS: From 2017 to 2019, CHANGE conducted fact-finding trips on the DREAMS Partnership that included documenting the impact of PLGHA. Using semi-structured interviews and focus groups,

CHANGE met with over 100 organizations across Eswatini, Malawi, Mozambique, Uganda, and Zimbabwe including civil society organizations, U.S. government, politicians, religious leaders, and AGYW in DREAMS districts. Interviews were audio recorded, transcribed, and coded. This presentation is the first time results have been analyzed across all five countries.

RESULTS: Protecting Life in Global Health Assistance has resulted in clinic closures, loss of community health workers, and has impeded critical partnerships, advocacy efforts, coalition structures, and referral networks among organizations that provide HIV and AIDS testing, counseling, and treatment.

In Mozambique, a sub-prime partner discontinued a DREAMS initiative as a result of the policy, laying off almost 90 percent of their community health workers. In Malawi, a DREAMS partner was unable to comply with the policy, resulting in a gap in services for AGYW. In Zimbabwe, a DREAMS sub-prime partner stopped all of their DREAMS programming, leaving young women without access to SRHR information and left out of economic and enrichment activities.

CONCLUSIONS: This is the first documentation of the impact of PLGHA on the DREAMS Partnership across multiple countries. The research supports the growing body of evidence on the negative impact of the policy across health systems and health outcomes.

MONITORING AND EVALUATION OF POLICIES AND THEIR IMPACT ON PEOPLE LIVING WITH HIV AND KEY POPULATIONS

PEF1881

MEDICAID EXPANSION IMPACTS ON HEALTH INSURANCE CHURN AMONG WOMEN LIVING WITH OR AT RISK FOR HIV IN THE UNITED STATES

A. Edmonds[1], N. Belenky[2], A. Adedimeji[3], M. Cohen[4], G. Wingood[5], M. Fischl[6], E. Golub[7], M. Johnson[8], D. Merenstein[9], J. Milam[10], T. Wilson[11], A. Adimora[1]

[1]University of North Carolina at Chapel Hill, Chapel Hill, United States, [2]RTI International, Research Triangle Park, United States, [3]Albert Einstein College of Medicine, Bronx, United States, [4]Stroger (Cook County) Hospital, Chicago, United States, [5]Columbia University, New York, United States, [6]University of Miami School of Medicine, Miami, United States, [7]Johns Hopkins University, Baltimore, United States, [8]University of California, San Francisco, United States, [9]Georgetown University Medical Center, Washington, United States, [10]University of Southern California, Los Angeles, United States, [11]State University of New York (SUNY) Downstate Medical Center, Brooklyn, United States

BACKGROUND: In the US, eligibility for Medicaid (health insurance for low-income people) varies by state. People can lose or gain Medicaid ("churn") as their finances change – a phenomenon affecting access to healthcare. Only some states have expanded Medicaid eligibility under the Affordable Care Act. We compared rates of insurance churn among women with and without HIV by adoption of Medicaid expansion in their states of residence.

METHODS: Data were analyzed from the Women's Interagency HIV Study (WIHS), where participants at 10 US sites self-reported insurance and residential address at semiannual visits. Geocoded addresses were merged to state-specific Medicaid expansion timing to create, for each woman-visit, a binary time-varying indicator of residence inside/outside a locale where Medicaid expansion had been adopted. Including visits at age <65 from 4/2008-3/2019, we used age-adjusted rate ratios (RRs) from Poisson regression to compare churn by Medicaid expansion and HIV status.

RESULTS: 3341 women (65% Black) contributed 43329 visits at median age 48, 70% by women with HIV, 27% under Medicaid expansion, and 48% with household income <$12000/year.

Women with [without] HIV reported no coverage and Medicaid, respectively, at 14% [19%] and 61% [51%] of visits.

Women in [not in] Medicaid expansion states reported no coverage and Medicaid, respectively, at 4% [20%] and 69% [53%] of visits.

Women with HIV had a lower rate of coverage loss (RR: 0.81, 95% CI: 0.70-0.95).

Medicaid expansion was associated with lower coverage loss (RR: 0.62, 95% CI: 0.53-0.72) and greater coverage gain (RR: 2.32, 95% CI: 2.02-2.67), with no differences by HIV status. Figure 1 depicts details of churn.

[Figure 1. Medicaid expansion impacts on health insurance churn in the WIHS]

CONCLUSIONS: Women in Medicaid expansion states had substantially better rates of coverage loss and gain. Medicaid expansion throughout the US should be expected to stabilize insurance for women with or at risk for HIV and improve downstream health outcomes.

PEF1882

IMPACT OF LEGAL PROTECTIONS ON SCALE-UP OF PREVENTION SERVICES FOR KEY POPULATIONS

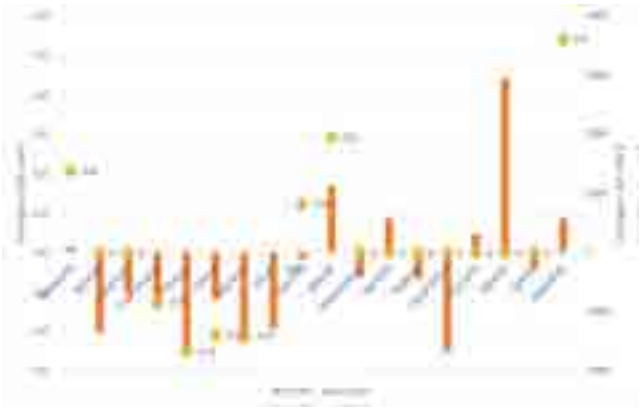
V. Vasireddy[1], M. Ruffner[1], J. Palen[1], M. Wollmers[1], A. Bush[2], N. Allyala[1]

[1]President's Emergency Plan for AIDS Relief (PEPFAR), US Department of State, Washington, United States, [2]USDA Food and Nutrition Service, Washington, United States

BACKGROUND: According to UNAIDS 2018 data, more than half of new global HIV infections are among KP and their sexual partners. The President's Emergency Plan for AIDS Relief (PEPFAR) continues investing in policy change that enables access and scale-up of tailored KP services.

DESCRIPTION: We analyze trends in KP prevention services from 2017 to 2019 across select countries. The Sustainability Index Dashboard (SID) is a tool developed by PEPFAR and UNAIDS and implemented by partner countries every two years to measure progress towards sustainable HIV/AIDS response. The SID measures changes in legal protections for men who have sex with men (MSM), Transgender people (TG), Female sex workers (FSW), and People who inject drugs (PWID). KP prevention services are measured using a PEPFAR indicator KP_PREV, which is defined as the number of KP reached with individual and/or small group-level HIV prevention interventions designed for target population.

LESSONS LEARNED: A decrease in SID score for KP legal protection from 2017 to 2019 is accompanied by a decline in KP_PREV. Similarly, countries that show a positive trend in the SID score show an increase in KP_PREV. Countries that did not show a change since 2017 also showed a decline in KP_PREV (chart below).



[Figure]

CONCLUSIONS/NEXT STEPS: The global distribution of new HIV infections in 2018 crossed a threshold where the majority of global new infections were among KP and their sexual partners. The UNAIDS fast-track strategy calls for a human-rights based approach and removal of punitive laws, policies, and practices that hinder effective program implementation.

This abstract shows an increase in the number of KP reached through tailored services when barriers are removed and there is an improvement in the legal and enabling environment for KP. In line with the UNAIDS strategy, PEPFAR continues to work towards removing these barriers and creating an enabling environment to scale-up KP services.

PEF1883

FROM "POPULATION GROUP" TO "BEHAVIOURAL RISK FACTORS": COMMUNITY RESPONSE SHIFTS PUBLIC HEALTH STRATEGIES FOR SEX WORKERS IN STBBI PREVENTION POLICIES IN CANADA

P.A. Sorfleet[1]
[1]Triple-X Workers' Solidarity Association of British Columbia, Vancouver, Canada

BACKGROUND: February 1, 2019 issue of the Lancet, K. Amico and Linda-Gail Bekker suggest that key population targeting for sex workers could actually contribute to stigma detrimental to successful PrEP roll-out:

"Targeted approaches carry potential unintended consequences. Programs that offer PrEP primarily to sex workers, for example, drive and create stigmas; PrEP becomes associated with being appropriate only for sex workers and sex workers seem to need this intervention more than others."

DESCRIPTION: PrEP in the context of sex work was the subject of a #SWPrEP national consultation in Canada in 2016 held at Dalla Lana School of Public Health. Sex workers and frontline staff from 23 organizations across Canada unanimously expressed concern that, "As stigma about sex work is high among health care providers, asking for PrEP because you fall into a 'target population' is highly problematic."

LESSONS LEARNED: Government health promotion agencies design HIV prevention resources and policies for sex workers based on global key population statistics that purport that sex workers are disproportionately affected by HIV. This risks undermining the capacity of community HIV service providers to design effective responses for important, specific local contexts and could lead to adverse outcomes.

"At a brothel, sex workers may be required to take PrEP as a condition of their working there, and then these brothels may use adherence to PrEP as an advertising ploy. If everyone takes PrEP in a workplace, sex workers may have less leverage with clients that they use condoms."

CONCLUSIONS/NEXT STEPS: Community follow-up from the #SWPrEP national consultation throughout 2017 and 2018 resulted in the removal of "commercial sex" as a risk factor in Canada's national PrEP prescriptIon guidelines, as well as from from provincial PrEP guidelines in British Columbia. In January 2019, correspondence with Triple-X Workers' Solidarity Association of BC, resulted in Public Health Agency of Canada updating Canadian Guidelines on STBBI: the section on sex workers was removed: "The revised guidelines focus on the diagnosis, treatment and follow-up of STBBI based on behavioural risk factors and not population groups."

Sex workers' sexual health—including STBBI prevention—would be best achieved through occupational health and safety programs.

PEF1884

INSURANCE COVERAGE AND VIRAL SUPPRESSION AMONG PEOPLE WITH HIV IN THE UNITED STATES, 2015-2017

L. Dawson[1], J. Kates[2]
[1]Kaiser Family Foundation, HIV Policy, Washington, United States, [2]Kaiser Family Foundation, Global Health & HIV Policy, Washington, United States

BACKGROUND: Health insurance coverage and access to care improve health outcomes, including viral suppression, for people with HIV in the United States. Prior research has demonstrated that the implementation of the Affordable Care Act (ACA) in 2014 increased coverage among people with HIV and that certain forms of coverage are positively correlated with sustained viral suppression. This study will update prior analysis to provide the latest nationally representative data in this area.

METHODS: Analysis will be based on data from the Medical Monitoring Project (MMP), a Centers for Disease Control and Prevention surveillance system producing nationally representative estimates of behavioral and clinical characteristics of adults with HIV in the U.S. Data for 2017, the most recent year available, will be analyzed as will trends since 2015. Where possible, data will be disaggregated by sex and race/ethnicity. Rao-Scott chi-square tests and prevalence ratios with predicted marginal means will be used for statistical comparisons.

RESULTS: Previously published analyses have shown that the ACA increased coverage for people with HIV and that their coverage patterns differ significantly from the general population. In 2015, Medicaid represented the largest source of coverage for people with HIV (40%), followed by private insurance (34%), and Medicare or other sources (15%), compared to 13%, 71%, 3%, respectively among the population overall. Due to the ACA, the share of uninsured people with HIV fell to 11%, on par with the general population. Almost half of people with HIV relied on the Ryan White HIV/AIDS Program. Sustained viral suppression was significantly higher among those with private insurance, Medicare, and Ryan White compared to the uninsured. Using the most up to date data available (through at least 2017) we will present our latest findings at the conference for the first time.

CONCLUSIONS: The findings from this study will provide the latest nationally representative data on insurance coverage of people with HIV in the U.S., as well as the relationship between coverage and vi-

ral suppression. Such data are critical for monitoring and assessing changes in the U.S. health financing landscape, and their impact on the coverage and health of those with HIV.

PEF1885

QUANTIFYING PEPFAR'S ROLE FOR WOMEN AND GIRLS: ANALYSIS OF MONITORING, EVALUATION, AND REPORTING INDICATOR DATA, 2016-2019

J. Kates[1], K. Moss[1]
[1]*Kaiser Family Foundation, Global Health & HIV, Washington, United States*

BACKGROUND: PEPFAR plays an important role in addressing HIV among women and girls, recently estimating that it will spend nearly $2 billion on such efforts. However, to date, program data have not been fully analyzed in this area. Quantifying the number and share of women and girls served by PEPFAR is a key component to better understanding the extent of its reach.

METHODS: Analysis of PEPFAR's Monitoring, Evaluation, and Reporting Indicator (MERS) database was conducted to identify the number of people, age 15+, by year (2016 to 2019) for four indicators: receiving testing and counseling services, newly testing positive, newly enrolled on antiretroviral therapy (ART) and currently on ART. Data were analyzed by sex (those with unknown age and unknown sex were excluded). Only data from the 25 countries required to submit country operational plans in FY 2019 (which account for the bulk of PEPFAR resources) were included.

RESULTS: Overall, the number of women served in these 25 countries increased across all indicators and women represent the majority of those reached. For example, the number of women receiving testing and counseling services rose from 10.5 million in 2016 to 12.2 million in 2019, and their share of all those receiving such services increased (62% to 65%). The number of women on ART also rose, from 7 million in 2016 to 9.7 million in 2019, though their share of the total was similar in each period (66% and 67%). While the number of women newly testing positive and newly enrolled on ART increased, their shares of the total decreased. There was some variation by country. For example, the share of women on ART ranged from a low of 30% in Viet Nam to a high of 72% in Cote d'Ivoire in 2019. The number of women served across these indicators rose in most but not all countries over the period.

CONCLUSIONS: The majority of those served by PEPFAR are women and girls, and a growing number have been reached over time. This analysis provides more granular data across four program indicators to better understand PEPFAR's role in reaching women and girls globally.

PEF1886

THE GLOBAL FUND HUMAN RIGHTS M&E REVOLUTION: DEMONSTRATING IMPACT OF COMPREHENSIVE HUMAN RIGHTS PROGRAMS

A. Iovita[1], R. Jurgens[1], J. Amon[2], N. Zorzi[3], L. Aloo[3]
[1]*The Global Fund, Community, Rights and Gender, Geneva, Switzerland,* [2]*Dornsife School of Public Health at Drexel University, Jonathan Mann Global Health and Human Rights Initiative, Philadelphia, United States,* [3]*The Global Fund, MECA, Geneva, Switzerland*

BACKGROUND: The Global Fund strategy 2017-2022 brought about commitment to scale up programs that remove human rights barriers to accessing HIV, TB and malaria services as part of its Strategic Objective on promoting and protecting human rights and gender equality. To support scale up to comprehensive levels and achieve better health for key populations and people affected, GF launched its Breaking Down Barriers initiative in 20 countries. The initiative entails significant additional catalytic funding; baseline assessments to document existing human rights-related barriers and those affected, programs to address them, gaps and costs; multistakeholder processes to develop plans for a comprehensive response to such barriers; technical assistance including for implementation; and mid-term and end-term assessments to document impact of scale-up.

DESCRIPTION: The human rights investment in BDB countries increased sevenfold and constitutes over 78 million. To demonstrate results of these investments, improve evidence base on what works to reduce barriers and increase access, and internal processes to track human rights performance of grants, GF with the help of a Working Group on Monitoring and Evaluating Programmes to Remove Human Rights Barriers:

(a) has developed a conceptual framework and methods for baseline and mid-term assessments;

(b) developed a GF Approach to human rights M&E;

(c) included human rights outcome indicators in its core indicators list and supported their use in grants performance frameworks;

(d) used local funding agents to verify programmatic and M&E compliance.

LESSONS LEARNED: The BDB initiative demonstrated that human rights barriers are widespread and affect access to services; and that effective programs to remove them are based on national strategic vision and commitment, are properly resourced and adequately monitored and evaluated to steer implementation, document results and lessons learnt. Internal and grant-oriented M&E processes are important elements of accountability of a funding mechanism as the GF.

CONCLUSIONS/NEXT STEPS: Human rights catalytic funding will also be available to the BDB countries in the new cycle, contributing to implementation of national plans for comprehensive evidence-informed responses. The GF approach to human rights M&E will extrapolate the lessons learnt from the BDB initiative to the overall GF portfolio, reaching the last mile and maximizing returns on investments.

PEF1887

HIV TREAT ALL POLICY IMPACT IN BOTSWANA, KENYA, LESOTHO AND RWANDA

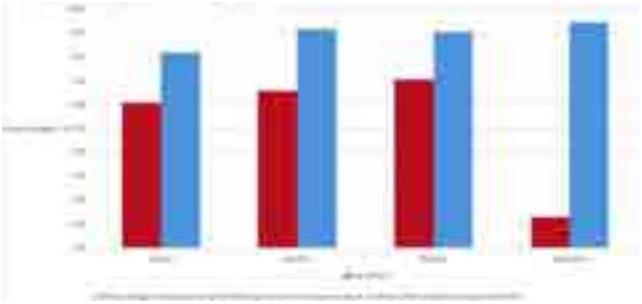
A. Verani[1], A. Russell[1], E. Galloway[1], L. Alexander[1], V. Reagon[1], S. Pals[1]
[1]*CDC, Global HIV and TB, Atlanta, United States*

BACKGROUND: In September 2015, the World Health Organization recommended HIV anti-retroviral therapy (ART) for all HIV-positive persons. As of July 2019, 93% of low- and middle-income countries had adopted a Treat All policy. We sought to examine the quantitative relationship between Treat All policy adoption and changes in uptake of HIV testing and ART initiation in countries supported by the United States President's Emergency Plan for AIDS Relief (PEPFAR).

METHODS: The analysis included four PEPFAR-supported countries that were implementing and evaluating their respective Treat All policies in 2016 (Botswana, Kenya, Lesotho, and Rwanda). Using routinely collected, PEPFAR program and policy data from 2015 to 2017 and statistical software, we analyzed the effect of national HIV

Treat All policies on HIV testing and treatment services. External and internal factors considered in the descriptive analysis included: PEPFAR expenditures on testing and treatment services, national investment, existence of national policies authorizing task sharing for HIV testing and ART, and policy implementation and dissemination strategies.

RESULTS: On average, the number of positive tests increased by eight percent and estimated linkage of those newly diagnosed to treatment initiation increased by 35 percent in the one year after government adoption of a Treat All policy, compared to the year before policy adoption. Considered as a whole, the four countries' estimated linkage increased from 54% in the year pre-policy adoption to 89% in the one-year post-policy adoption. Changes varied by country (see chart).



[Figure. Estimated linkage increased by 35% on average in one year after policy adoption, compared to the year prior.]

CONCLUSIONS: There was an observable increase in estimated linkage after adoption of Treat All policies in these four countries. Further analyses will utilize country-specific data to understand additional contextual factors and more precisely articulate the observable impact of Treat All policies in PEPFAR-supported countries.

POLICIES THAT ENABLE INCREASED DEMAND, UPTAKE AND RETENTION OF KEY POPULATIONS FOR HIV SERVICES AND PROGRAMMES

PEF1888

EXPECTATIONS MISMATCH BETWEEN STAKEHOLDERS OF ASSISTED PARTNER NOTIFICATION PROGRAM IN INDONESIA: A QUALITATIVE STUDY

G.B.S. Wirawan[1], I.G.N. Mahendra[1], N.P.A. Harjana[1], N.K. Lestari[2], L. Luhukay[3], H. Dewi[3], P.P. Januraga[1]
[1]Udayana University, Center for Public Health Innovation, Denpasar, Indonesia, [2]Sanglah General Hospital, Department of Tropical Medicine, Denpasar, Indonesia, [3]Indonesian Ministry of Health, Jakarta, Indonesia

BACKGROUND: In 2016 WHO released a recommendation on assisted partner notification (aPN) services which recommended for assisted referrals. Beginning in 2018 Indonesia began PN pilot projects in 6 demonstration sites across the nation. Our research aims to explore experiences and expectation of partner notifications among different stakeholders.

METHODS: We conducted a formative study in three demonstration cities: Jakarta, Semarang, and Denpasar. Data were collected using focus group discussions and online survey. Respondents participated in the FGDs consist of 24 healthcare providers 16 people from PLHIV communities and 14 people of the general population. Information gathered includes expected idealized version of aPN initial mode of contact and messages protocol as well as concerns regarding implementation of aPN. There were 76 respondents who participated in the online survey. Qualitative data were analyzed using thematic analysis while quantitative data from online survey were analyzed descriptively.

RESULTS: Different stakeholder groups have different concerns and ideal protocol regarding aPN. Providers and PLHIVs both prefer an initial contact through short messages or phone call with initial message that elicit visit to clinic/hospital while concealing information of potential HIV exposure. Providers prefer this protocol as it protect them from backlash and partners' negative reaction. PLHIVs prefer it due to protection of confidentiality. General population (i.e. potential partners) prefer initial contact by home visit with messages that directly disclose HIV exposure and elicit HIV test. This preference is confirmed from online survey data where 43% respondents prefer home-visit as initial mode of contact, and 70% prefer messages that disclose HIV exposure, directly or indirectly. They are concerned with potential of apathy should the notification fail to disclose potential HIV exposure. Other concerns from providers include additional workload how aPN would affect their personal life. PLHIV other concerns was confidentiality and worried that aPN implementation would inadvertently compromise their HIV status to unwanted parties.

CONCLUSIONS: There is discrepancy of expectation on ideal aPN protocol between providers, PLHIVs, and general population. It mainly stems from different concerns regarding its outcome and risks. Development of aPN protocol should be able to pacify all these concerns to maximize compliance from all stakeholders.

PEF1889

LESSONS LEARNED FROM THE STRATEGIC AGENDA FOR KEY POPULATIONS: EXPERIENCES FROM BRAZIL

D.A. Calixto[1], G.C. da Silva[1], N.D. Araújo[1,1], G.F.M. Pereira[1]
[1]Ministry of Health of Brazil, Department of Diseases of Chronic Conditions and Sexually Transmitted Infections, Brasilia, Brazil

BACKGROUND: HIV epidemic in Brazil is concentrated in key populations (KPs) – men who have sex with men, transgender people, drug users, people deprived of liberty, and female sex workers. Despite the existence of laws and policies that address KPs specific needs, there is evidence of widespread discriminatory attitudes and practices towards these populations, addended to stigma and discrimination, which remain as thick barriers to accessing services and care related to HIV. In 2018, the Ministry of Health of Brazil (MoH) designed an intervention called "Strategic Agenda to Expand Comprehensive Access and Care for Key Populations in HIV, Viral Hepatitis, and Other STIs" as part of a broader initiative known as "Zero Discrimination" launched by UNAIDS, contributing to the goal of "ending AIDS by 2030".

DESCRIPTION: The MoH developed guidelines and worked along with other Ministries, UN organizations, and civil society in order to develop seven lines for strategic actions that are urgent to overcome the current challenges related to KPs:

1) Health education,
2) Comprehensive care,
3) Health Communication,
4) Stigma and discrimination,

5) Social participation,
6) Management and governance, and,
7) Strategic Information.
The MoH provides technical assistance to monitoring and sensitization to other partners, such as local AIDS Programs in Brazil.
LESSONS LEARNED: The Strategic Agenda for Key Population enabled the MoH to establish strategic partnerships to implement a set of actions, which we believe are urgent to overcome current challenges for a better response to HIV, Viral Hepatitis, and other STIs. It also enabled the expansion of comprehensive access and care for KPs, paving the way for approaches in relation to stigma, discrimination, and its vulnerabilities.
CONCLUSIONS/NEXT STEPS: Key Populations' Strategic Agenda has supported the MoH to engage key partners in creating sustainable and long-term efforts aimed at the promotion of access and comprehensive care towards KPs. The Agenda has also increased KPs access in public health policies in order to promoting equitable access in health services.

PEF1890

HOW WE ACHIEVED A STATEWIDE COORDINATED PUBLIC HEALTH RESPONSE TO ENDING THE HIV EPIDEMIC

J. Morne[1]
[1]*New York State Department of Health, AIDS Institute, Albany, United States*

BACKGROUND: An individual's health care needs are complex and involve a myriad of medical to social issues (i.e., housing). These social issues that affect an individual's life and impact communities can no longer be treated in isolation from one another, as they have a huge influence on how effective care and treatment interventions will be. Therefore, a comprehensive coordinated approach to health care involving collaboration with clinical and social service providers, the public and private sectors, community leaders and groups, and different levels of government must be developed. In 2014, New York State (NYS) met this challenge.
DESCRIPTION: In 2014, NYS made HIV/AIDS history by announcing the Ending the Epidemic (ETE) Initiative, the first jurisdictional effort of its kind in the United States. ETE's key benchmark of lowering annual HIV infections to 750 by the end of 2020, would be accomplished by identifying persons with HIV, linking and retaining persons diagnosed with HIV in health care, and facilitating access to Pre-Exposure Prophylaxis (PrEP) for high risk persons to keep them HIV negative.
LESSONS LEARNED: ETE was the impetus for establishing a statewide coordinated public health response that resulted in the implementation of evidence-based strategies and programs that addressed the social and structural barriers, ensured equitable access to care and treatment, and improved engagement and retention in care and treatment for people with HIV. As a result of these efforts, NYS has achieved historic reductions in new HIV infections and diagnoses. From 2014-2018, new HIV diagnoses in NYS were reduced by 28%, in contrast to a 16% reduction from 2010-2014. The post-ETE progress was 1.6x's that of the pre-ETE progress; and an analysis of the data revealed that the decrease in new HIV diagnoses was observable across nearly every demographic group, including sex, age, race/ethnicity, and transmission risk.
CONCLUSIONS/NEXT STEPS: While NYS is on its way to ending the epidemic, we continue to see health care disparities related to race and gender and must escalate our health equity initiatives to reverse these trends. Providing culturally appropriate non-judgmental education, health care, and treatment facilitates removal of barriers (i.e., stigma) resulting in better health outcomes.

INTEGRATION OF HIV WITH OTHER HEALTH SERVICES (INCLUDING CO-INFECTIONS AND NCDS)

PEF1891

DESIGNING HEALTH CARE POLICY AND CARE SYSTEMS TO REACH AND RETAIN THOSE WITH SEVERE MENTAL ILLNESS IN HIV PREVENTION AND CARE EFFORTS: INSIGHTS FROM FIVE US STATES

E. Arnold[1], K. Koester[1], L. Dawson[2], J. Walkup[3], F. Cournos[4], S. Crystal[5], C. Mangurian[6]
[1]*University of California, Center for AIDS Prevention Studies, Dept of Medicine, San Francisco, United States,* [2]*Kaiser Family Foundation, Washington DC, United States,* [3]*Rutgers University, Clinical Psychology Department, Piscataway, United States,* [4]*Columbia University, Department of Clinical Psychiatry, New York, United States,* [5]*Rutgers University, Center for Health Services Research, New Brunswick, United States,* [6]*University of California, Department of Psychiatry, San Francisco, United States*

BACKGROUND: People with severe mental illness (SMI) are up to ten times more likely to have HIV infection than the general US population. Despite this increased prevalence, robust efforts to engage this population in routine HIV testing, timely linkage to and on-going engagement in care, and treatment adherence have been uneven. We sought to identify solutions at the health care delivery system level, as well as policies at the state and local level, that might affect HIV-related health outcomes for this key population and inform "Ending the HIV Epidemic" efforts.
METHODS: Using a case study design, we recruited key stakeholders in California, Illinois, Louisiana, New York and Texas to participate in semi-structured interviews which were recorded and transcribed. Informants included state and county-level public administrators in HIV and/or behavioral health; HIV and behavioral health clinic administrators, medical providers and case managers; service providers at non-profit agencies serving those with SMI and/or HIV; and academics. Interview topics included: HIV testing policies and systems, HIV linkage and treatment policies and organization of SMI and HIV health care systems, recent care integration efforts, and electronic data sharing. Transcripts were coded for broad themes, and segments were further reduced for key content.
RESULTS: Between September 2018 and December 2019, we conducted 27 key stakeholder interviews. Key factors leading to improvements in HIV-related outcomes for those with SMI include: state and local efforts to integrate physical and mental health services, funding requirements for behavioral health agencies to perform HIV testing, efforts to offer routine HIV screening in emergency departments and drug treatment facilities, linkage to care programs for those re-entering communities post-incarceration, shared electronic health records, and charismatic leaders at the state or local level. Fragmented and decentralized physical and behavioral health care systems, policies that limited data sharing, stigma, and a lack of collegial working relationships between behavioral health and infectious disease leaders were perceived barriers to improved HIV outcomes for those with SMI.

CONCLUSIONS: Case studies in five high HIV prevalence states yield important insights into health care delivery systems and policies that improve HIV-related health outcomes for those with SMI.

FOREGROUNDING ACCOUNTABILITY WITHIN THE HIV RESPONSE

PEF1892

DEVELOPMENT OF YOUTH-LED HIV/AIDS COUNTRY SCORECARD FOR NIGERIA

I.E. Ekanem[1]
[1]Education as a Vaccine (EVA), Advocacy/Policy Influencing Unit, Abuja, Nigeria

BACKGROUND: The scorecard developed tracks and document laws, policies, plans, commitments and the implementation of the National HIV strategy for AYP, ascertain the nature and extent to which youth organizations/associations/networks are involved in the scale-up of the HIV response, and engage youth organizations/associations/networks in the process as a strategy to strengthen youth-led social accountability to end the AIDS epidemic in Nigeria.

DESCRIPTION: We identified and selected youth leaders representing youth-led and focus organizations/associations/networks (15-20 young men and women) that are actively advocating/working for improvements on youth's HIV/SRHR to participate in the development of the Scorecard (Efforts were made to ensure the participation of youth from Key Populations as defined by UNAIDS and representatives of organizations based outside Abuja who will work virtually);
: A mixed-method approach was employed for this study using an Uproot Report Card (Questionnaire) developed by PACT to extract information on Laws and policies, leadership, beneficiaries, participation and partnership as it relates to ending the HIV/AIDS epidemic by 2030. Data collected, collated was analyzed by the #uproot report card and HIV/SRH Youth-led organizations, MDA, and UNAIDS in a workshop.

LESSONS LEARNED:

- LAWS AND POLICIES -2.8%
- PARTICIPATION 50%
- PARTNERSHIP 40%
- BENEFICIARIES -9.4%
- LEADERSHIP 10%

If the result is below 50%, it is indicative that youth organizations/networks that are representative of AYP most affected by the epidemic in the country, who completed this report card, perceive that their country is off-track to ensuring an enabling environment, including protective laws and policies, not supported, not building or strengthening partnerships, not benefitting and are not are not taking up leadership roles in decision-making spaces. to guarantee AYPs access to HIV and SRHR.

CONCLUSIONS/NEXT STEPS:

- Major investments, technical support and political commitment by all stakeholders is needed to critically assess this gaps and are not posing obstacles to young people's access to HIV/SRHR and Youth organizations, should monitor closely the quality and level of AYPs engagement in different decision-making spaces.

PEF1893

TRANSNATIONAL ACTIVISM FOR AN EFFECTIVE, COMPREHENSIVE HIV RESPONSE: LESSONS FROM THE COALITION TO MOBILIZE POWER ACTIVISM, STRATEGY, SOLIDARITY (COMPASS) AFRICA

E. Bass[1], M. Luba[2], M. Ighodaro[1]
[1]AVAC, New York, United States, [2]AVAC, Lilongwe, Malawi

BACKGROUND: HIV/AIDS advocacy and activism have transformed the epidemic in countries, communities and globally. Resources for advocacy and activism are shrinking at the moment that they are required; approaches to advocacy funding reflect donor perceptions of optimal strategic and/or the exigencies of grant making. It's critical to understand the types of activist architecture (in terms of coalitions, funding and strategic planning) that effectively redistribute power and ensure accountability at community, national and global levels.

DESCRIPTION: The Coalition to Build Activism Power Strategy and Solidarity (COMPASS) Africa was launched in November 2017 to unite civil society coalitions in Malawi, Tanzania and Zimbabwe with advocacy partners from the region and global North in a coalition committed to bold "business unusual" activism and action. The coalition began work with a set of "campaigns" with predefined "wins" in thematic areas core to a comprehensive response. After two years, the coalition looked back at progress against pre-specified goals and unanticipated progress in thematic areas.

LESSONS LEARNED: Of the 14 campaigns defined at the outset, we recorded wins in 29 percent of the campaigns and partial wins in an additional 50 percent. Looking at "wins" in focal areas that were not pre-defined in the campaigns, half of the work resulted in tangible shifts in policy, program design or investment and against the specific campaigns as defined by partners.
We assert that the difference reflects the degree to which successful advocacy and activism redirects efforts and seizes opportunities as they arise. The consistent challenges in domestic resource mobilization and the consistent successes in the "differentiated service delivery" space across the two analyses reinforce the degree to which there are significant challenges for the former, and significant donor-driven prioritization for the latter. Partners' own experiences of these patterns is already informing new strategies and COMPASS-wide work.

CONCLUSIONS/NEXT STEPS: The COMPASS approach has demonstrated impact by:

- Linking diverse groups with well-differentiated roles into a coalition focused on activism at headquarters and country levels.
- Funding strategic approaches, not static outcomes, within a framework focused on impact, not deliverables.
- Focusing on audacious activism with sharply-defined targets, bold tactics and robust use of data and evidence.

PEF1894

LESS TALKING ABOUT US AND MORE HEARING FROM US: WHY SO FEW WOMEN / TRANS PEOPLE LIVING WITH HIV AS SPEAKERS, ORAL ABSTRACT CO/AUTHORS, AND ABSTRACT PRESENTERS AT AIDS 2018?

M. Tholanah[1], C. Chung[2], A. Welbourn[3], E. Bell[3], F. Hale[3]
[1]Community Activist/Advocate, Harare, Zimbabwe, [2]Transgender Law Center, San Francisco, United States, [3]Salamander Trust, London, United Kingdom

BACKGROUND: Women living with HIV are key to research, programme development and implementation. Yet at AIDS2016 only 2% of women abstract presenters self-identified as living with HIV. No trans abstract presenters self-identified as living with HIV.
Did AIDS2018 provide more meaningful opportunities for women living with HIV - as invited speakers, abstract presenters, or co/authors of oral abstracts?
METHODS: Analysis of:

- IAS data on women and transgender people living with HIV as invited speakers and abstract presenters at AIDS2018, compared to AIDS2016 data.
- AIDS2018 Abstract Book for oral abstracts relevant to women living with HIV, and authored or co-authored by organisations of people living with HIV and/or key populations.

RESULTS: IAS data shows fewer opportunities at AIDS2018 than AIDS2016 for women living with HIV to present our work.

- Women presenters of abstracts self-identifying as living with HIV dropped from 2% of women presenters in 2016 to 1.8% in 2018. Among invited women speakers, 11% self-identified as living with HIV in 2016, falling to 9% in 2018.
- Trans abstract presenters went from 14 people (1% of all presenters) in 2016 to 20 people (0.7% of all presenters) in 2018. 2 trans presenters self-identified as living with HIV in 2018 (compared to 0 in 2016). Invited transgender speakers fell from 8 in 2016 to 4 in 2018, none self-identifying as living with HIV.

AIDS2018 Abstract Book:

- Only 2 oral abstracts (2/225 = 0.9%) co/authored by organisations of people living with HIV and/or key populations and focused specifically on women living with HIV, of which one (1/225 = 0.4%) trans women living with HIV.
- In total, only 8% of oral abstracts (19/225) co/authored by organisations of people living with HIV and/or key populations and of (potential) relevance to women living with HIV in all our diversity.

CONCLUSIONS: It is disappointing to see such low numbers of women / trans people living with HIV as speakers, presenters and oral abstract co/authors in 2018, even compared to 2016.
The IAS should address this so that future conferences do not continue to talk ABOUT us and instead hear from us, as invited speakers, and as oral abstract co/authors and presenters.

PEF1895

PEPFAR WATCH: INCREASING U.S. GOVERNMENT ACCOUNTABILITY THROUGH NORTH-SOUTH SOLIDARITY

M. Milanga[1], R. Lusimbo[2], S. Nakasi[3], M. Happy[4], K. Mwehonge[5], L. Rutter[6], A. Yawa[7], M. Luba[8]
[1]Health GAP, Nairobi, Kenya, [2]Sexual Minorities Uganda (SMUG), Kampala, Uganda, [3]Uganda Network of AIDS Service Organisations (UNASO), Kampala, Uganda, [4]International Community of Women Living with HIV East Africa (ICWEA), Kampala, Uganda, [5]Coalition for Health Promotion and Social Development (HEPS), Kampala, Uganda, [6]Health GAP, Johannesburg, South Africa, [7]Treatment Action Campaign, Johannesburg, South Africa, [8]AVAC, Lilongwe, Malawi

BACKGROUND: Among countries facing a high burden of HIV, the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) is often the largest source of funding for HIV treatment and prevention. Holding PEPFAR accountable to the goals and priorities of people living with HIV (PLWHIV) and communities most affected by HIV is critical to ensuring an HIV response that is high impact and driven by evidence and human rights.
DESCRIPTION: In order to increase PEPFAR's accountability to PLWHIV, we have established "PEPFAR Watch," a flexible network of national and global civil society advocacy organizations working in solidarity in more than 22 countries. PEPFAR Watch equips activists with the technical capacity to develop a critical understanding of in-country PEPFAR program performance data and to translate their treatment and prevention priorities into strategies and targets that are concretely reflected in their country's PEPFAR "Country Operational Plans" (COPs). Beginning in 2018, PEPFAR Watch members developed the "People's COPs," activist shadow reports describing advocacy demands generated from community-led monitoring and fact-finding efforts at the site of HIV treatment and prevention service delivery. In Uganda, Malawi, South Africa, Kenya, and beyond, People's COPs have been used to highlight poor program performance and to use data to support advocacy to correct substandard outcomes, resulting in important PEPFAR program shifts in treatment and prevention.
LESSONS LEARNED: As a result of these evidence-based advocacy approaches, activists in countries receiving PEPFAR funding have secured important policy victories, such as improving the quality and coverage of service delivery for men who have sex with men and other criminalized populations in Uganda, increased funding for high impact, indigenous key population-led organizations; increased remuneration and recruitment of professional and lay health workers to improve loss-to-follow-up rates; and national community-led clinic monitoring and advocacy programs to fix treatment retention crises.
CONCLUSIONS/NEXT STEPS: Accountability to end-users of HIV programs is a non-negotiable component of a successful HIV response. Our model of North-South global solidarity has been used to highlight and close gaps in accountability that have triggered an off-track HIV response. Our approach could be expanded to other countries and donors in order to extend impact.

PEF1896

SAVING OUR LIVES: COMMUNITY-LED MONITORING AND ADVOCACY TO CORRECT THE HIV RETENTION CRISIS

A. Yawa[1], L. Rutter[2]
[1]Treatment Action Campaign, Johannesburg, South Africa, [2]Health GAP, Johannesburg, South Africa

BACKGROUND: The effectiveness of the HIV response is today highly variable—across populations and geographies. HIV programs that implement models of care that are responsive to the priorities, demands, and human rights of people living with HIV (PLWHIV) demonstrate excellent treatment retention. In South Africa, community-led monitoring of HIV service delivery quality is a vital intervention to challenge and correct poor HIV treatment outcomes and high rates of loss to follow up among PLWHIV, and to increase the accountability of the most powerful actors in the HIV response: the South African government, along with PEPFAR and the Global Fund to Fight AIDS, Tuberculosis and Malaria.

DESCRIPTION: In South Africa, Treatment Action Campaign (TAC), as a member of the PLWHIV sector, with technical support from Health GAP and Georgetown University, began implementation community-led monitoring and advocacy in September 2019, called Ritshidze ("Saving Our Lives"), to correct the HIV treatment retention crisis. Monitors are trained to carry out routine clinic visits and conduct data collection using tools developed by their communities. Activists then analyse the findings and develop advocacy interventions to correct the problems uncovered through monitoring. By September 2020, Ritshidze is expected to cover 400 clinics representing more than 50% of PLWHIV on treatment nationwide.

LESSONS LEARNED: Ritshidze has successfully launched community-led monitoring of service delivery, trained and supported clinic monitors to watchdog service delivery quality, initiated data collection and analysis and more. A database has been established to support routine assessment and analysis of the state of service delivery quality in various high volume clinic settings, so trends in service delivery quality can be easily gauged by activists--increasing real time public accountability of policymakers.

CONCLUSIONS/NEXT STEPS: Neither mortality reduction nor incidence reduction are on track to reach the 2020 global goals; the treatment retention crisis in South Africa is typical of many high burden countries facing unacceptably high rates of loss to follow up. Our initial findings from the Ritshidze programme indicate that community-led monitoring holds promise as an intervention to help fix the HIV retention crisis in South Africa through evidence based advocacy and could be used as a model extending beyond South Africa.

PEF1897

IMPLEMENTATION OF THE LOCAL INNOVATION SPREAD THROUGH ENTERPRISE NETWORK MODEL; LESSONS LEARNED FROM KENYA

B. Okiya[1], N. Kilonzo[2], M. Dybul[3], S. Kim[3], D. Bazira[3], S. Ojoo[3.3], B. Lukoba[4.4], J. Moraa[2.2], K. Ranji[5.5], S. Amolo[5.5], V. Waringa[6.6], K. Kimani[7.7], C. Ngare[5], S. Kretschmer[8], E. Mwadime[2], J. Gitini[7], S. Kibwana[3], A. Woodworth[3]
[1]National AIDS Control Council, Policy Monitoring and Rsearch, Nairobi, Kenya, [2]National AIDS Control Council, CEO, Nairobi, Kenya, [3]Georgetown University Medical Center, Center for Global Health Practice and Impact, Washington DC, United States, [4]National AIDS Control Council, HIV Investments, Nairobi, Kenya, [5]National AIDS Control Council, Coordination and Support, Nairobi, Kenya, [6]Homa Bay County, MOH, Homa Bay, Kenya, [7]Kiambu County, MOH, Homa Bay, Kenya, [8]DesireLine, Founder, Instabul, Turkey

BACKGROUND: The National AIDS Control Council-Kenya with support from Centre for Global Health Practice and Impact (CGHPI) of Georgetown University has been supporting Kiambu and Homa Bay Counties to implement the Local Innovation Spread Through Enterprise Network (LISTEN) Model. The LISTEN Model is an innovative and accountability network model that focuses on Communities of Practice (CoP) using a Human Centered Design (HCD) approach to strengthen delivery of services (both Health and Non-Health) in the two (2) Counties. The model aims at;

1. Promoting access to key health services
2. Making communities resilient
3. Promoting accountability for results at all levels from community to county leadership
4. Enhancing communication for timely decision making

DESCRIPTION: The model involves the Harnessing communities of practice including priority populations such as Fisher folk and "Boda Boda" riders by identification and linking across all the four levels of the model from the ward, county and national levels. The vertical and horizontal linkages are done through the identified champions with the innovative team providing the technical support. Data is then customized to each CoP for more effective collection, use, and performance. To enhance innovation and sustainability, the human-centered design is used to catalyze the engagements. The CoPs develop charters and integrate HIV and Health indicators into what matters to them. Linkage and accountability meetings are held to review the performance based on the charters.

LESSONS LEARNED:

1. Communities have a potential;
2. Linkage of the CoPs across the model enhances accountability for results;
3. The model reduces duplication of services
4. The model helps in integrating HIV/Health into non-health programmes.
5. The model enhances sustainability and communication for timely decision making

CONCLUSIONS/NEXT STEPS: The LISTEN is an important strategy for enhancing; sustainability during transitioning and accountability for results in resource limited setting for HIV Prevention, treatment and care. Next steps include;

1. Scale up based on lessons learnt.
2. Enhance data visibility across the levels.
3. Monitor and review the implementation, institutionalization and implementation of the model against the CoP performance metrix.

IMPLICATIONS OF UHC ON KEY POPULATIONS' ACCESS TO HIV PROGRAMMING/SERVICES

PEF1898

FINDING THE GAP: NATIONAL IDENTIFICATION, UNIVERSAL HEALTH COVERAGE AND ACCESS TO HIV SERVICES AMONG KEY POPULATIONS IN JAKARTA, INDONESIA

M.A. Setyawan[1], L. Permana[2], C. Francis[2], E.R. Aditya[2]
[1]*FHI 360, LINKAGES, Community Based Services Unit, Jakarta, Indonesia,*
[2]*FHI 360, LINKAGES, Jakarta, Indonesia*

BACKGROUND: The government of Indonesia launched its ambitious universal health coverage (UHC) program in 2014. This program aims to ensure that all Indonesians, whether rich or poor, have access to quality health services without suffering undue financial hardship. The Indonesia UHC program is now the largest single-payer scheme in the world, covering 203 million people across the country. However, individual access to UHC is predicated on whether a person has a national identification card and can demonstrate residence in the area where they seek care factors that may limit participation of key population (KP) individuals and affect their access to HIV prevention and treatment services.

DESCRIPTION: The LINKAGES project, supported by USAID and PEPFAR and led by FHI 360, systematically tracked national identification and health insurance status among KP individuals reached in community-based outreach and case management interventions delivered in Jakarta, Indonesia to identify potential gaps in UHC coverage which could adversely affect HIV service access and uptake.

LESSONS LEARNED: Between October 2018 and September 2019, less than 1% of the 56,424 men who have sex with men (MSM), female sex workers (FSWs), people who inject drugs (PWID), transgender (trans) women, and sexual partners of KP members reported that they did not have a national identification card. In addition, approximately 17% (n=9,638) of KP individuals who did have national identification cards did not show their residence as Jakarta, with the majority of FSWs and transwomen officially living in other locales. Female sex workers and transwomen particularly those with HIV-negative or unknown status also were more likely to report that they had no health insurance compared to MSM, PWID, and sexual partners of KP members.

CONCLUSIONS/NEXT STEPS: HIV surveillance from 2018 found that more than 50% of MSM, FSWs, and KP partners had never tested for HIV; therefore, it is critical to identify structural barriers which may affect access and uptake of HIV services. Systematically tracking national identification and health insurance status and providing resources to assist KP individuals to procur relevant documentation may be necessary in contexts where HIV burden remains high.

PEF1899

PLHIV'S ACCESS TO HEALTH SERVICES THROUGH NATIONAL HEALTH INSURANCE IN INDONESIA: A CASE STUDY IN THREE CITIES

J. Kaunang[1], H.P. Utama[1], P.K. Sucahya[1], E.D. Nuriana[2], S. Putri[1], S. Manalu[1]
[1]*Indonesia AIDS Coalition, Program Division, South Jakarta, Indonesia,*
[2]*International Labor Organization, Jakarta, Indonesia*

BACKGROUND: In order to protect its citizen's rights on access to social protection, Indonesia's government launched a national health program in 1997, which enhanced into a more comprehensive and mandatory program called the Jaminan Kesehatan Nasional (JKN), translated into National Health Insurance in 2014, targeting 95% coverage in 2019. This study was conducted in three main cities in Indonesia, namely Denpasar, South Jakarta, and Makassar to understand the level of access to this health insurance among PLHIV.

METHODS: This study was conducted in three main cities in Indonesia's HIV program, which are South Jakarta, Denpasar, and Makassar using the cross sectional or survey research as study design. Population sampled are PLHIV who participate in JKN, and was sampled using the Slovin Formula (simplification of the Lemeshow formula) of the PLHIV population. Data collection was conducted in 12-30 November 2018.

RESULTS: Out of the total of 258 respondents, all of which are member of the JKN and are PLHIV, 96% of them currently holding active membership, and 95% of them are actively using JKN in accessing health services. As much as 60% of the respondents claim that JKN system is sufficient for their needs, and more than 90% of the respondents admit that JKN is highly beneficial towards PLHIV and key population. Although, 16% still receive discrimination in terms of their HIV status, while 17% admit being discriminated for being a part of key population.

This study also finds that there are five factors that are directly impacting PLHIV's, which are; issue of participation, portability, tiered referrals, benefit packages, and treatment classes. All these factors are seriously hampers PLHIV's access to treatment due to its complicated process.

CONCLUSIONS: Although JKN and its implementation is still flaw and needs several further improvements, study shows that PLHIV benefits from this system more than they obstructed by the challenges. Participate in JKN has proven to facilitate PLHIV in accessing healthcare without being financially burdened. Main recommendation from this study are: more comprehensive treatment packages, shortcuts in referrals, and friendlier and more supportive healthcare providers towards PLHIV and key population.

PEF1900

WHAT ABOUT THE HEALTH OF TRANS WOMEN IN LATIN AMERICA AND THE CARIBBEAN? CHALLENGES TO HIV DIAGNOSES AND LACK OF COMPREHENSIVE HEALTH CARE

M. Romero[1]
[1]*Red Latinoamericana y del Caribe de Personas Trans (RedLacTrans), Ciudad Autónoma de Buenos Aires, Argentina*

BACKGROUND: Between April 2016 and March 2019, during the implementation of "Trans Women Without Borders against Transphobia and HIV/AIDS", the proposal of the Global Fund to Fight AIDS, Tuberculosis and Malaria, RedLacTrans developed the only Health Guide prepared by Trans people from Latin America and the Caribbean with the objective of sensitizing professionals in the area of health about comprehensive care for this population.

DESCRIPTION: RedLacTrans conducted 122 sensitization workshops in 13 different countries in Latin America and the Caribbean, addressing a total of 4429 health providers sensitized about comprehensive health care and HIV-AIDS diagnoses towards Trans people. The "Suggested guidelines of comprehensive healthcare for Trans women in Latin America and the Caribbean" is a tool that allows to increase the reach towards the recipients and advocates the reduction of discriminatory practices in health centers, which prevent Access of Trans people to health services.

LESSONS LEARNED: The sensitization workshops, which were led by Trans women, allowed health providers to be sensitized from their own expertise; This practice highlighted the importance of Trans people sensitizing Health professionals about their own needs. In addition, these instances were the first steps to achieve inter-institutional agreements: between Civil Society Organizations and Hospitals to guarantee unrestricted access to health services. Among other achievements, we celebrate the opening of Health Centers that respect gender identity and the diagnosis of those living with HIV-AIDS.
CONCLUSIONS/NEXT STEPS: The local scope shows the importance of promoting political strategies integrated by the key populations in articulation with the Governments to guarantee Trans people access to Human Right of Health: effective and quality.

PEF1901

CHILDREN'S RIGHT AND HIV

K. Clement[1]
[1]*University of Calabar, Department of Social Sciences, Calabar, Nigeria*

BACKGROUND: The awareness program on the rights of a child with HIV/AIDS were conducted in six (6) government owned community Junior Secondary schools across the six geopolitical zones in Nigeria where HIV/AIDS were statistically predominant as at March 2019 which include Benue, Akwa Ibom, Kano, Imo, Bauchi, and Lagos. The program was aimed at drawing attention as well as creating more awareness on these rights and to disabuse the dangerous attempt to limit children access to information about a range of issues such as sex, education, drug use and sexuality in the name of protection.
METHODS: The study population survey has 1,850 respondents comprising of students (mixed gender) between the age of 10-18 years. The grass root school sensitisation program was in three (3) stages: before the program, the program and after the program. Analysis of the impact of the program were done six (6) weeks after the program. Pretested semi structured questionnaire and simple random sampling technique were used. Data collected were analysed using frequency counts, percentage, means and Pearson product moment correlation. Four (4) null hypotheses were tested at 0.05 level of significance.
RESULTS: At the pre-sensitisation stage, the study and control group were similar in their socio-demographic characteristics, HIV knowledge/ child's right. After the sensitisation program those with good knowledge on child's right / HIV, sex education, drug use, sexuality and positive attitude towards HIV/AIDS infected and affected individual increased from 34% to 70.5 %,50.0% to 87.5%,32.6%to 68.5%and from 48.0% to 86.5% respectively($p<0.05$)
CONCLUSIONS: Although significant momentum for addressing the rights of children affected by HIV/AIDS has been generated to some extent at global, regional and national level, complicated challenges persist with respect to grass root community schools. Hence, more robust grass root sensitisation to other area across the six geographical zones hitherto not reached is highly recommended and systematically encouraged.

PUB001

REFUGEE RESILIENCE AS A PATHWAY FOR HIV PREVENTION

P. Learmonth[1], A. Lombard[1], P. Mhongara[1]
[1]*University of Pretoria, Social Work, Pretoria, South Africa*

BACKGROUND: South Africa is a popular destination for African refugees fleeing conflict. Displacement makes women and girls, disproportionately vulnerable to the risk of HIV:

1. They have suffered trauma and violence, including sexual violence during conflict and flight.
2. Traditional community support structures are destroyed during displacement.
3. HIV prevention campaigns and education in countries of asylum are often not in the language of the refugee.

The goal of the study was to determine whether Future Families NPO (FF) refugee program, supported by United Nations High Commission for Refugees provides an enabling environment for refugees to develop resilience and consequently reduce their risk of HIV infection by overcoming socio-economic adversities.

METHODS: The study was part of a broader qualitative study exploring resilience in promoting sustainable livelihoods among OVC and families in adversity. The study used a phenomenological research design to conduct one on one interviews guided by a semi-structured schedule. Participants included service users and providers in the South African regions where FF operates. Participants were purposively selected according to criteria that reflect resilience. This paper reports on the interviews with the 5 refugees who participated in the study in the category service users. Data were analyzed according to themes, supported by Atlas.ti software.

RESULTS: Findings indicate resilience of refugees is strengthened by a designated program enabling them to overcome socio-economic adversities and hence reduce their vulnerability and risk for HIV infection. Refugees' resilience is strengthened by a program respecting their dignity and abilities, engaging them in activities such as material and psycho-social support, providing access to education and health services, developing human and social capital, and facilitating earning sustainable livelihoods. Participation in the program activities concomitantly enhances their knowledge of HIV/AIDS awareness and prevention.

CONCLUSIONS: Refugees displaying resilience have a reduced risk for HIV infection. Organisations engaging refugees in programs, where refugees are engaged, not as victims but as people with agency who only need the knowledge, opportunity and support to create sustainable livelihoods.

PUB002

HIV STATUS DISPARITIES IN SUBSTANCE USE DISORDER TREATMENT NEED AND UTILIZATION AMONG ADULTS IN THE UNITED STATES, 2015-2018: IMPLICATIONS FOR HEALTHCARE SERVICE ACCESS

M.M. Philbin[1], B.S. West[2], J.E. Diaz[3], L.R. Smith[4], P.M. Mauro[3]
[1]*Columbia University Mailman School of Public Health, Sociomedical Sciences, New York, United States,* [2]*Columbia University, School of Social Work, New York, United States,* [3]*Columbia University Mailman School of Public Health, Epidemiology, New York City, United States,* [4]*University of California at San Diego, San Diego, United States*

BACKGROUND: Substance use disorders (SUD) are associated with HIV acquisition and disruptions in HIV medication adherence and care engagement. However, we lack national-level data on SUD treatment disparities by HIV status since most research on people living with HIV (PLWH) and SUD focuses on clinical samples. We used nationally representative data to estimate SUD treatment need and utilization by HIV status.

METHODS: The 2015-2018 National Survey on Drug Use and Health included 170,750 individuals aged 18 and older. Respondents self-reported whether a healthcare professional ever told them they had HIV (i.e., HIV-negative, HIV-positive/PLWH, HIV-unknown). Outcomes included past-year: 1) SUD treatment need (i.e., met SUD criteria and/or reported treatment use; 2) any SUD treatment use; 3) specialty SUD treatment use (e.g., drug/alcohol rehabilitation, inpatient hospital, mental health center). Weighted multivariable modified poisson regression models estimated likelihood of each outcome by HIV status, adjusting for age, gender, race/ethnicity, income and survey year.

RESULTS: Overall, 0.2% (n=337) were PLWH and 0.3% (n=620) reported HIV-unknown status. SUD treatment need differed by HIV status: HIV-negative (8.2%), PLWH (26.4%), and HIV-unknown (11.7%). Among people who needed SUD treatment (n=18,460), past-year SUD treatment utilization differed—HIV-negative (14.3%), PLWH (36.7%), and HIV-unknown (34.3%)—as did specialty SUD treatment utilization—HIV-negative (11.1%), PLWH (32.2%), and HIV-unknown (33.9%). In adjusted models, PLWH were more likely than HIV-negative individuals to need SUD treatment (aRR=2.87; 95% CI=2.35-3.52). Among people who needed treatment, PLWH were more likely to report past-year SUD treatment utilization (aRR=2.57; 95% CI=1.44-2.75) or past-year specialty SUD treatment utilization (aRR=2.20; 95% CI=1.54-3.14) than HIV-negative individuals. People with HIV-unknown status were more likely than HIV-negative individuals to report past-year specialty SUD treatment utilization (aRR=2.32; 95% CI=1.14-4.72).

CONCLUSIONS: PLWH had a higher SUD treatment need than HIV-negative individuals. Among those with SUD treatment need, PLWH had higher treatment utilization overall and, along with HIV-unknown individuals, higher specialty treatment utilization. As SUD is associated with adverse HIV outcomes, our findings highlight the need for the integration of comprehensive SUD treatment with HIV care and testing. Increasing access to SUD treatment tailored for PLWH could help reduce SUD-related negative outcomes in HIV care.

PUB003

A QUALITATIVE EXPLORATION OF HOW POLICIES THAT CRIMINALIZE SEX WORK IMPACT HIV-RELATED RISK BEHAVIORS AND HEALTH DISPARITIES AMONG RACIAL, SEXUAL, AND GENDER MINORITY YOUTH

M.M. Philbin[1], H.M. Wurtz[1], N.J. LaBossier[2], E.N. Kinnard[3], L.R. Smith[3], A.E. Tanner[4]
[1]Columbia University Mailman School of Public Health, Sociomedical Sciences, New York, United States, [2]Boston University School of Medicine, Boston, United States, [3]University of California at Berkeley, Berkeley, United States, [4]University of North Carolina at Greensboro, Greensboro, United States

BACKGROUND: The impact of socio-structural factors on HIV vulnerabilities and related disparities is well established (e.g., stigma, homelessness, employment). However, little work has explored how state-level policies in the United States that regulate sex work affect HIV-related behaviors for sexual and gender minority youth of color (SGMYC), a population with disproportionately high HIV rates.

METHODS: We conducted 68 qualitative interviews from April 2018-June 2019 in New York City with Latinx and/or Black SGMYC ages 18-29 (n=30) as well as with community stakeholders across the U.S. at agencies serving SGMYC (n=38). Interviews were recorded, transcribed and analyzed using thematic content analysis to explore how sex work criminalization policies affect SGMYC's vulnerability to HIV.

RESULTS: Participants felt that policies criminalizing sex work: 1) necessitated behaviors that increased HIV-related vulnerabilities; 2) did not address the root causes of sex work; and 3) perpetuated stigma. First, criminalization forced behaviors that increased SGMYC's HIV-related risks, "It's affecting the kids. You can catch an STD doing sex work." Such policies also forced SGMYC to hide: "They're just going to do it underground, and not in safer ways." Second, criminalization ignored the root causes of sex work: "You're having sex with various people, sometimes unprotected because you can't say 'No,' if you haven't eaten for days." SGMYC identified potential health risks but felt hard-pressed to change behaviors because "this is how people survive." Third, criminalization perpetuated stigma by disproportionately affecting groups already facing HIV-related disparities: "I knew it's illegal, but who's knocking down a door to give a transgender a job?" Participants provided suggestions for policy reform: "Criminalization won't make it go away...decriminalizing it allows for that dialogue of safety in sex work."

CONCLUSIONS: Punitive sex work policies disproportionately affect SGMYC and challenge their ability to engage in HIV prevention. Increased attention to how sex work criminalization policies impact SGMYC's HIV-related vulnerability, and meaningfully engaging SGMYC in policy decisions, is essential to reduce SGMYC's disproportionate HIV burden. Interventions that incorporate policy change to reduce the structural drivers of HIV disparities among SGMYC are sorely needed to promote their health.

INDUCTION OF CROSS-NEUTRALIZING ANTIBODIES AND PROTECTION FROM HETEROLOGOUS TIER-2 SHIV CHALLENGE BY AN MRNA-BASED VACCINE IN MACAQUES

P. Zhang[1], M. Prabhakaran[2], S. Ding[3], Y. Tsybovsky[4], E. Narayanan[5], A. Carfi[5], S. Himansu[5], Y. Lin[1], D. Rogers[1], Q. Liu[1], H. Miao[1], X. Chen[2], E.K. Sarfo[2], D.R. Ambrozak[2], R. Gautam[6], M.A. Martin[6], D. Weiss[7], J. Misamore[7], J.R. Mascola[2], A. Finzi[3], A. McDermott[2], P. Lusso[1]
[1]NIH, LIR, NIAID, Bethesda, United States, [2]NIH, VRC, Bethesda, United States, [3]University of Montreal, Montreal, Canada, [4]NIH, ATRF, NCI, Frederick, United States, [5]Moderna Inc, Cambridge, United States, [6]NIH, LMM, NIAID, Bethesda, United States, [7]Bioqual Inc., Rockville, United States

BACKGROUND: Despite intensive research over the past four decades, an HIV-1 vaccine capable of inducing broadly neutralizing antibodies (bNAbs) and protection from heterologous tier-2 strains is still wanting.

METHODS: We tested the immunogenicity and efficacy of an mRNA-based vaccine that expresses native, membrane-anchored HIV-1 envelope (Env) glycoproteins in combination with SIVmac239 Gag in order to promote the in vivo formation of virus like particles (VLP). Rhesus macaques were immunized with 8 sequential mRNA immunizations or mRNA followed by protein boosts with purified homologous SOSIP trimers over a period of one year. The Envs included WITO (a clade-B transmitter-founder strain) BG505 (clade A) and DU422 (clade C).

RESULTS: Env trimer-binding antibodies (Abs) were readily induced after the second immunization, showing increasing titers and durability after each booster injection. Following the third heterologous boost, cross-neutralizing Abs against tier-2 viruses of different clades started to appear in all animals, reaching higher and more stable titers after the last immunization. After challenge with heterologous tier-2 SHIV (AD8) by 12 repeated low-dose rectal inoculations, significant protection was observed in a group of animals, with no difference between those immunized with mRNA vs. mRNA+protein. Extensive immunologic analyses identified three significant correlates of protection: i) Abs to a glycanated CD4-binding site (CD4-BS) gp120 core protein; ii) Abs to the AD8 Env trimer expressed on the surface of infected cells; iii) Abs mediating ADCC against the closed AD8 Env trimer. Abs to both the CD4-BS and the trimer apex were visualized in the serum of protected animals by electron microscopy polyclonal mapping. By single B-cell cloning and antibody amplification from a protected macaque, we derived a panel of mAbs that share genetic similarities with previously identified macaque and human bNAbs against the CD4-BS. Detailed functional characterization of these mAbs will be presented at the Conference.

CONCLUSIONS: These results provide evidence that extensive immunization with mRNA encoding multiple heterologous membrane-anchored HIV-1 Envs can induce cross-clade neutralization and partial protection from heterologous tier-2 virus challenge.

FUNDING: Supported in part by the intramural research programs of the NIAID DIR and VRC, and by the NIH Office of AIDS Research (OAR).

BACKGROUND: More than 30% of new HIV infections globally occur among youth ages 15 to 24 years. Thus, a vaccine that induces protective antibodies prior to sexual debut is critical for prevention of HIV in this population. A successful HIV vaccine will likely require induction of broadly neutralizing antibodies (bnAbs), yet this remains a challenge. Native conformation envelope (Env) trimers, such as BG505 SOSIP.664, are ideal immunogens given their enhanced ability to elicit antibody responses against vulnerable sites of the HIV Env that are the targets of bnAbs. As HIV-infected children have been shown to develop bnAbs earlier and at a higher frequency than adults do, the infant immune landscape may be more amenable to the induction of bnAb B cell lineages. Furthermore, immunization in childhood provides the opportunity for long term, multi-dose immunization prior to adolescence. The goal of our study was to assess the ability of a B cell lineage-designed HIV Env trimer to induce bnAb lineages in early life.

METHODS: Infant rhesus macaques (RMs) received 50mg of either the BG505 wild type (WT) SOSIP trimer or the BG505 germline-targeting (GT1.1) SOSIP trimer (n=5/group) with the 3M-052-SE adjuvant at 0, 6, and 12 weeks of age. All 10 infant RMs were then boosted with the BG505 WT SOSIP trimer at weeks 26 and 52, mimicking a pediatric immunization schedule of multiple vaccine boosts within the first two years of life.

RESULTS: Both immunization strategies induced durable, high magnitude binding antibody responses with the peak IgG responses at week 14. Plasma neutralization responses against BG505 tier 1 and 2 virus variants were enhanced after the 4th immunization at week 28 compared to week 14. Two GT1.1-immunized infants exhibited a plasma HIV neutralization signature reflective of CD4 binding site-specific bnAb precursor development. Moreover, this bnAb precursor neutralization signature continued to rise following immunization while other neutralization responses declined, potentially indicating continued maturation of this lineage.

CONCLUSIONS: A multi-dose immunization regimen in infants with a B cell lineage designed SOSIP trimer is a promising strategy for inducing HIV bnAbs throughout childhood to elicit protective HIV immunity prior to adolescence, when sexual HIV exposure risk begins.

OAALB0103

CCR5 ANTIBODY BLOCKADE PROTECTS RHESUS MACAQUES FROM RECTAL SHIV ACQUISITION

X. Chang[1], G. Webb[1], J. Reed[1], C. Pessoa[1], H. Wu[1], N. Burnett[2], M. Fischer[2], C. Moats[2], J. Smedley[2], D. Burger[3], N. Pourhassen[3], J. Greene[1], J. Sacha[1]
[1]Oregon Health and Science University, Vaccine and Gene Therapy Institute, Beaverton, United States, [2]Oregon Health and Science University, Oregon National Primate Research Center, Beaverton, United States, [3]CytoDyn, Inc., Vancouver, United States

BACKGROUND: Adherence remains a challenge to the success of pre-exposure prophylaxis (PrEP) in preventing HIV acquisition. Thus, new approaches are urgently needed. The primary use of the CCR5 co-receptor by mucosally transmitted virus, together with the resistance to infection observed in CCR5-delta 32 homozygous people, suggests that CCR5-blocking reagents might be effective PrEP agents. Leronlimab is a CCR5-specific monoclonal antibody with excellent safety and adherence profile used in over 800 HIV+ people. We hypothesize that leronlimab can protect from the sexual transmission of HIV.
METHODS: To determine if subcutaneous leronlimab at the lowest and highest doses tested in clinical trials (10 mg/kg or 50 mg/kg in rhesus macaques via allometric scaling) could prevent sexual transmission of SHIV, we conducted a study in macaques using low-dose intra-rectal SHIVSF162P3 challenges. Three groups of six macaques received either no treatment or leronlimab at 10 mg/kg weekly or 50 mg/kg bi-monthly. We monitored longitudinally for plasma viremia, CCR5 occupancy, cell-associated virus, and anti-SHIV immune responses.
RESULTS: Following eight weekly challenges, all animals treated with 50 mg/kg were protected from acquisition, while all control animals became infected (p=0.0005). Four animals treated with 10 mg/kg were fully protected, while two animals were infected following the last two challenges (p=0.001). Of these two infected animals, one developed anti-leronlimab antibodies resulting in rapid leronlimab clearance, while the other maintained CCR5 occupancy with the lowest longitudinally viral loads. Colon and duodenum biopsies taken from the protected animals after completion of all challenges showed complete CCR5 occupancy and absence of cell-associated viral DNA and RNA. Following leronlimab uncoating from CCR5, protected animals remained aviremic and lacked anti-SHIV immune responses for at least six weeks before sacrifice, indicating sterilizing protection from rectal SHIV acquisition.
CONCLUSIONS: These results support the efficacy of leronlimab as PrEP, with the potential development of long-acting leronlimab to improve adherence.

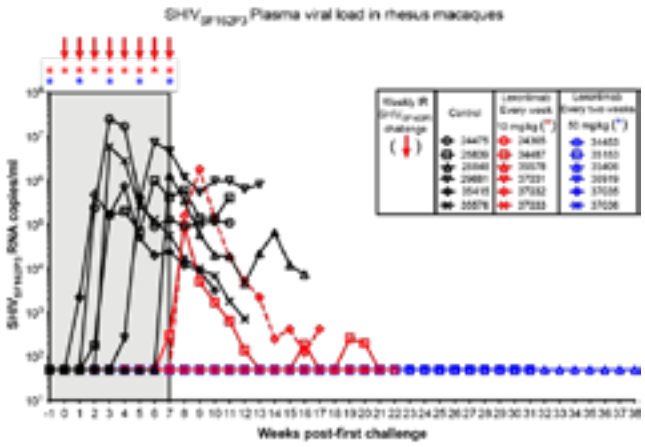

Figure 1: Leronlimab PrEP prevents intrarectal (IR) SHIVSF162P3 infection. One-week prior to the start of weekly, low-dose, intra-rectal challenges of SHIVSF162P3 (red arrow), animals received 10 mg/kg leronlimab weekly (red asterisk) or 50 mg/kg leronlimab bi-monthly (blue asterisk). The grey box indicates the timeframe for leronlimab treatment and intra-rectal challenges. Weekly plasma viral loads are presented over weeks post-first challenge for animals that received no treatment (black line), 10 mg/kg leronlimab (red line), and 50 mg/kg leronlimab (blue line). One animal developed anti-drug antibody (dashed line).

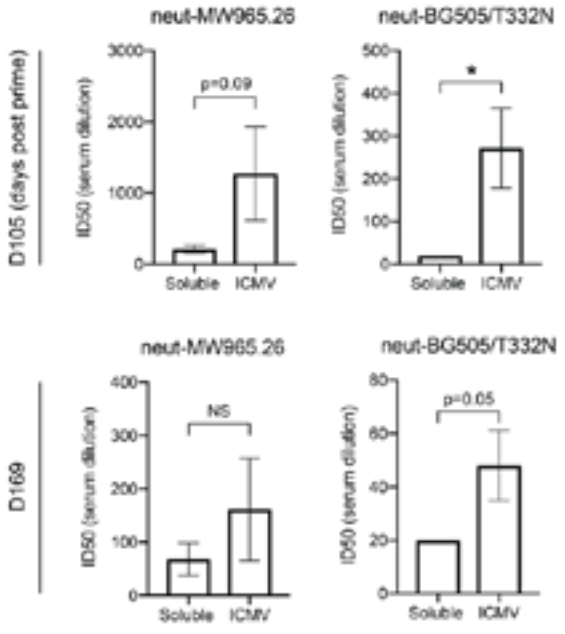
VACCINATION AGAINST HIV-1 WITH INTERBILAYER CROSS-LINKED MULTILAMELLAR VESICLES CARRYING SOSIP TRIMER

C. Park[1,2], J. Bazzill[2,3], J. Moon[1,2,3]
[1]University of Michigan, Department of Biomedical Engineering, Ann Arbor, United States, [2]University of Michigan, Biointerfaces Institute, Ann Arbor, United States, [3]University of Michigan, Department of Pharmaceutical Sciences, Ann Arbor, United States

BACKGROUND: Successful vaccination against human immunodeficiency virus-1 (HIV-1) has been an elusive goal. Prior research has shown that nanoparticle systems can facilitate antigen delivery to lymph nodes and enhance immune responses. However, during encapsulation of protein antigens in nanoparticles, the conformation of epitopes can be altered, thus negatively impacting the potency of the vaccines. We have previously developed interbilayer cross-linked multilamellar vesicles (ICMV) as a vaccine delivery platform [1]. Here, we optimized our ICMV technology to deliver HIV envelope glycoprotein (BG505 SOSIP.664 Env Trimer).
METHODS: Rabbits were prime immunized on day 0 with 30 μg of SOSIP and 50 μg MPLA and boosted on day 28 and 84, each with 12.4 μg of SOSIP and 20.6 μg of MPLA by subcutaneous injections at four sites on both caudal thighs. Blood samples were collected from marginal ear vein on day 105 and 169 for neutralization study.
RESULTS: New ICMV formulation with a mean diameter of ~300 nm allows for ~30% loading efficiency of SOSIP. ICMV preserves the conformational epitopes in SOSIP protein complex as confirmed by PAGE and direct immunofluorescence staining with HIV-1 neutralizing antibodies. Rabbits were immunized three times with SOSIP-containing ICMVs, leading to elicitation of robust humoral immune responses. SOSIP-ICMV immune sera neutralized homologous tier 1A (MW965.26) and 2 (BG505/T332N) viral entry to TZM-bl cells, which was not observed from soluble control (Figure).



[Figure]

CONCLUSIONS: ICMV may be a promising vaccine platform for vaccination against HIV-1 and other infectious pathogens.

ACKNOWLEDGEMENT: This work was supported by NIH R01AI127070. We thank Dr. John Moore and Rogier Sanders for providing BG505 SOSIP.664 Env Trimer.

SAFETY, PHARMACOKINETICS AND EFFICACY OF LOW-DOSE E/C/F/TAF IN VIROLOGICALLY SUPPRESSED CHILDREN ≥2 YEARS OLD LIVING WITH HIV

E. Natukunda[1], A. Liberty[2], R. Strehlau[3], E. Hellstrom[4], J.G. Hakim[5], H. Kaur[6], H. Maxwell[6], P. German[6], Y. Shao[6], D.M. Brainard[6], C. Pikora[6]
[1]Joint Clinical Research Centre, Kampala, Uganda, [2]Chris Hani Baragwanath Academic Hospital, Soweto, South Africa, [3]University of the Witwatersrand, Empilweni Services and Research Unit, Rahima Moosa Mother and Child Hospital, Department of Paediatrics and Child Health, Faculty of Health Sciences, Johannesburg, South Africa, [4]Be Part Yoluntu Centre, Western Cape, South Africa, [5]University of Zimbabwe, Avondale, Zimbabwe, [6]Gilead Sciences Inc., Foster City, United States

BACKGROUND: Elvitegravir(EVG)/cobicistat/emtricitabine/tenofovir alafenamide(TAF) (E/C/F/TAF) is a single-tablet regimen (STR) approved for HIV treatment in children ≥6y and ≥25 kg. Previous data reported no bone or renal toxicity of E/C/F/TAF in 50 children 6-<12y. We report safety, pharmacokinetics (PK), and efficacy from interim analyses of the first clinical trial of low-dose E/C/F/TAF tablet in young children with HIV.

METHODS: Virologically suppressed children (≥2y), 14-<25 kg, HIV-1 RNA <50 c/mL for ≥6 months, CD4 ≥200 cells/μL received low-dose E/C/F/TAF (90/90/120/6mg) once daily in a, single-arm, open-label trial. Adverse events (AE), laboratory data, and proportion of participants with virologic suppression were assessed through W24. Steady-state PK of E/C/F/TAF was evaluated; EVG AUCtau and TAF AUCtau in children were compared to those in E/C/F/TAF-treated adults (150/150/200/10 mg).

RESULTS: 27 children were enrolled; median age 6y (range 3-9y), median weight 19 kg (15-24 kg), 63% female, 89% Black, median CD4 count 1061 cells/μL (383-2401 cells/μL),. Most common AEs were upper respiratory tract infection (6 participants [22%]), cough (5 [19%], decreased appetite (4 [15%]). All AEs were grade 1 or 2; no child discontinued STR for AE. 27 participants (100%) maintained HIV-1 RNA <50 c/mL by M=E at W16, with 10/11 (91%) at W24 (one participant had HIV-1 RNA between 200 to <400c/mL). Mean change (% change) in CD4 count from baseline was -95 cells/mL (-0.3%) at W24. EVG and TAF geometric mean AUCtau estimates were modestly (<2-fold) higher in children vs adults (table). Exposures of all analytes remained within range of historical data. Most children found swallowability, acceptability, and palatability favorable at all timepoints assessed.

CONCLUSIONS: E/C/F/TAF low-dose STR was acceptable with high virologic suppression. E/C/F/TAF exposures in young children were within range of adult historical data. Safety and efficacy of low-dose STR in young children are consistent with full-strength STR efficacy in older populations.

CLINICAL OUTCOMES BY HIV SEROSTATUS, CD4 COUNT, AND VIRAL SUPPRESSION AMONG PEOPLE HOSPITALIZED WITH COVID-19 IN THE BRONX, NEW YORK

V.V. Patel[1], U.R. Felsen[2], M. Fisher[3], M.J. Fazzari[4], M.S. Ginsberg[4], R. Beil[1], M.J. Akiyama[1], K. Anastos[1], D.B. Hanna[4]
[1]Albert Einstein College of Medicine, Montefiore Health System, Division of General Internal Medicine, Department of Medicine, Bronx, United States, [2]Albert Einstein College of Medicine, Montefiore Health System, Division of Infectious Diseases, Department of Medicine, Bronx, United States, [3]Albert Einstein College of Medicine, Montefiore Health System, Division of Nephrology, Department of Medicine, Bronx, United States, [4]Albert Einstein College of Medicine, Montefiore Health System, Department of Epidemiology and Population Health, Bronx, United States

BACKGROUND: It is unknown whether people living with HIV (PLWH) are at greater risk for adverse outcomes due to COVID-19 than people without HIV infection or if, among PLWH, outcomes are associated with CD4 count and viral suppression (VS). Bronx County in New York City is an epicenter of both the HIV epidemic and COVID-19 in the United States.

METHODS: We conducted a retrospective cohort study of SARS-CoV-2 PCR-positive patients admitted to a large tertiary academic health system in the Bronx, New York between March 10 and May 11, 2020. HIV-related data came from the Einstein-Rockefeller-CUNY Center for AIDS Research Clinical Cohort Database[DH1] . Outcomes assessed were in-hospital intubation, acute kidney injury (AKI), mortality, and length of stay (LOS). To compare outcomes between PLWH and those without HIV infection we used multivariable regression models, adjusting for age, gender, and race/ethnicity. Outcomes were explored among PLWH according to CD4 count and VS.

RESULTS: Among 4,662 patients, median age (IQR) was 65 (54-76); 47% were female. Most were either non-Hispanic Black (36%) or Hispanic (37%), and 80% had public health insurance. Overall, 77 (1.7%) were PLWH, among whom the most recent HIV viral load was undetectable (<40 copies/mL) in 83%; most recent CD4 was <200 cells/uL in 16%, 200-499 cells/uL in 44%), and ≥500 cells/uL in 40%. Overall, 10/77 (13%) PLWH and 634/4585 (14%) without HIV were intubated, and 29/77 (38%) PLWH and 1881/4585 (41%) without HIV developed AKI. In-hospital mortality was 14/77 (18%) among PLWH and 1037/4585 (23%) among those without HIV. Hospital LOS was 5 days

(3-9) for both PLWH and those without HIV who were discharged. HIV status was not significantly associated with mortality, intubation, AKI or LOS. In exploratory analyses among PLWH with CD4 count available (N=73), higher CD4 count was associated with intubation (adjusted odds ratio 1.36 per 100 cells/uL, 95% CI 1.02-1.82). None of the 10 viremic PLWH were intubated, versus 10/57 (18%) among suppressed PLWH.

CONCLUSIONS: In hospitalized patients with COVID-19, there were no significant differences in intubation, AKI, mortality, and LOS between PLWH and without HIV. Our preliminary findings regarding intubation among PLWH warrant further examination.

OABLB0103

THE PREDICTED RISK OF ADVERSE PREGNANCY OUTCOMES FROM TREATMENT-INDUCED OBESITY IN THE ADVANCE TRIAL

S.F. Asif[1], A. Qavi[1], E. Baxevanidi[1], K. McCann[1], C. Serenata[2], W.D.F. Venter[2], N. Chandiwana[2], S. Sokhela[2], A. Hill[3]
[1]Imperial College London, Faculty of Medicine, London, United Kingdom, [2]Wits Reproductive Health and HIV Institute, Ezintsha, University of the Witwatersrand, Johannesburg, South Africa, [3]Liverpool University, Department of Translational Medicine, Liverpool, United Kingdom

BACKGROUND: Dolutegravir (DTG) is associated with obesity, especially when combined with tenofovir alafenamide (TAF) in black females. Obesity increases the risk of adverse pregnancy outcomes (APOs). We aimed to predict the 10-year risk of APOs caused by DTG-induced obesity, using the ADVANCE trial as a model.

METHODS: A systematic review was performed, evaluating the association between pre-pregnancy obesity and APOs. The relative risk (RR) for each APO in women with obese (≥30kg/m^2) versus normal BMIs (18.5-24.9kg/m^2) was calculated. To model the risk prediction, 1000 pregnant women with normal baseline BMIs were allocated to each treatment-arm of ADVANCE (TAF/FTC/DTG, TDF/FTC/DTG, TDF/FTC/EFV). The ADVANCE treatment-induced obesity rates were applied to this model to calculate the number of obese and normal BMI women at 96-weeks. This was combined with APO RRs to predict the number of women experiencing APOs with each treatment at 96-weeks.

APO	Relative Risk		TAF/FTC/DTG		TDF/FTC/DTG		TDF/FTC/EFV	
	RR	95% CI	Baseline	96-weeks	Baseline	96-weeks	Baseline	96-weeks
Preterm delivery	1.33	(1.19,1.48)	70	73	70	71	70	70
Gestational Hypertension	3.68	(2.97,4.55)	28	39	28	34	28	29
Gestational diabetes mellitus	4.31	(3.18,5.85)	16	23	16	19	16	16
Pre-eclampsia	4.06	(3.09,5.33)	25	35	25	30	25	26
Postpartum haemorrhage	1.23	(1.01,1.50)	112	115	112	114	112	112
Caesarean section	1.64	(1.55,1.73)	213	232	213	224	213	215
Small-for-gestational-age infants	0.84	(0.76,0.93)	89	87	89	88	89	89
Large-for-gestational-age infants	2.04	(1.65,2.52)	134	154	134	145	134	137
Low birthweight infants	1.01	(0.56,1.80)	64	65	64	64	64	64
Macrosomia	2.48	(2.10,2.93)	31	37	31	34	31	31
Stillbirth	1.39	(1.01,1.92)	4	4	4	4	4	4
Neonatal death	1.57	(1.00,2.48)	2	2	2	2	2	2
Neural tube defect	2.53	(1.15,5.55)	0	0	0	0	0	0

[Table]

RESULTS: At 96-weeks, the percentage of women becoming obese was 14% for TAF/FTC/DTG, 8% for TDF/FTC/DTG and 2% for TDF/FTC/EFV. The RR of APOs in women with obese versus normal BMIs was significantly higher for most APOs. Women were predicted to have a higher risk of APOs with DTG-regimens compared to TDF/FTC/EFV, noticeably with TAF/FTC/DTG. From baseline to 96-weeks, the predicted increase in APOs for women receiving TAF/FTC/DTG, TDF/FTC/DTG, and TDF/FTC/EFV was 9.9%, 5.2% and 0.9%, respectively.

CONCLUSIONS: Treatment-emergent obesity with TAF/FTC/DTG and to a lesser extent, TDF/FTC/DTG, could increase the risk of APOs in black females. The increase in APOs with TAF/FTC/DTG was almost double that of TDF/FTC/DTG. These predictions are likely underestimates of the APO risk with DTG-induced obesity as weight gain continues past Week 96. Longer-term follow-up of women and their infants is required.

OABLB0104

IMMUNOLOGIC CHARACTERISTICS OF ACUTE COVID-19 IN PEOPLE WITH HIV

H. Ho[1], M. Peluso[2], C. Margus[1], J.P. Matias Lopes[1], C. He[1], M. Gaisa[1], G. Osorio[1], J. Aberg[1], M. Mullen[1]
[1]Icahn School of Medicine at Mount Sinai, New York, United States, [2]University of California, San Francisco, San Francisco, United States

BACKGROUND: Data on the immunologic impact of SARS-CoV-2 co-infection in people living with HIV (PLWH) are limited.

METHODS: We conducted a retrospective study of clinical and immunologic outcomes of COVID-19 in 93 PLWH presenting to 5 New York City emergency departments who tested positive for SARS-CoV-2 by nucleic acid amplification.

RESULTS: Median previous CD4+ T lymphocyte count was 554 cells/uL, and 57/68 individuals (83.8%) had recent plasma HIV-1 RNA measurements below 50 copies/mL. Sixty-two of 89 (69.6%) were on antiretroviral therapy (ART) that included tenofovir. At presentation, PLWH with COVID-19 demonstrated significant lymphopenia and decreased CD4+ T cell counts. Levels of inflammatory markers, including C-reactive protein (CRP), fibrinogen, and D-dimer were commonly elevated. Serum cytokine profiles during acute COVID-19 were characterized by elevated interleukin (IL)-6, IL-8, and TNF-alpha, but not IL-1b.

Of 72 PLWH hospitalized with COVID-19, 16 (22.2%) died, 48 (66.7%) recovered, and 8 (11.1%) remained hospitalized at the time of analysis. Those who died had significantly lower nadir absolute lymphocyte counts during COVID-19 compared with those who recovered. Peak inflammatory markers including CRP, fibrinogen, and IL-6 were significantly higher in those who died; there were non-significant trends toward IL-8 and TNF-alpha elevations. No difference was observed in age, sex, BMI, duration of HIV infection, nadir, preceding, or presenting CD4+ T cell count, or viral suppression preceding or during the COVID-19 presentation. A greater proportion in the recovered group was on a regimen containing tenofovir, but the difference was not statistically significant.

CONCLUSIONS: PLWH who died of COVID-19 had significantly higher levels of soluble markers of immune activation and inflammation and more severe lymphopenia than those who survived. Our findings indicate that a subset of PLWH are capable of mounting profound inflammatory responses that have been noted to correlate with poor outcomes in people without HIV. Taken together, these findings raise important concerns that PLWH remain at risk for severe manifestations of COVID-19 despite ART, and that prominent immune dysregulation in a subset of PLWH during infection is associated with worse outcomes. Further studies are warranted to determine whether inflammatory pathways are exacerbated or potentiated in some PLWH compared with the general population.

OABLB0105

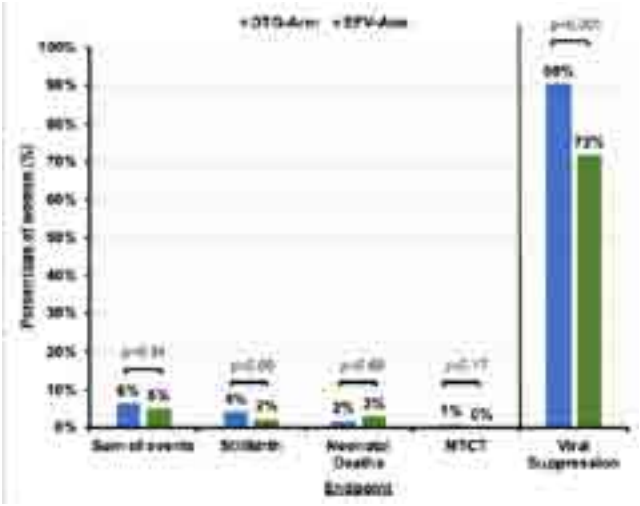
FASTER VIROLOGICAL SUPPRESSION WITH DOLUTEGRAVIR VERSUS EFAVIRENZ IN PREGNANCY DOES NOT LOWER THE RISK OF HIV MOTHER-TO-CHILD-TRANSMISSION: A META-ANALYSIS OF 5 CLINICAL TRIALS IN 1074 PREGNANT WOMEN

S.F. Asif[1], E. Baxevanidi[1], W.D.F. Venter[2], C. Serenata[2], A. Hill[3]
[1]Imperial College London, Faculty of Medicine, London, United Kingdom, [2]Wits Reproductive Health and HIV Institute, Ezintsha, University of the Witwatersrand, Johannesburg, South Africa, [3]Liverpool University, Department of Translational Medicine, Liverpool, United Kingdom

BACKGROUND: Dolutegravir (DTG) is part of the updated first-line antiretroviral treatment. However, literature surrounding the safety and efficacy of DTG in pregnant women remains insufficient as most early drug trials excluded this population from enrolment. A meta-analysis was conducted to collate the data emerging from newer RCTs that measure pregnancy outcomes with DTG use.

METHODS: Clinicaltrials.gov was searched for RCTs that compared DTG+2 NRTIs against the control treatment, EFV+2 NRTIs, in pregnant women. The primary endpoints included viral suppression, the number of stillbirths, neonatal deaths and HIV mother-to-child-transmissions (MTCT). Secondary endpoints included the number of mothers and infants experiencing ≥1 adverse event, preterm births and small-for-gestational-age infants. Using the Mantel-Haenszel test with random-effects modelling, risk difference and odds ratio were calculated.

RESULTS: The following five trials were selected: DOLPHIN-1, DOLPHIN-2, IMPAACT 2010, ADVANCE and NAMSAL to provide a sample of 1074 pregnant women for analysis. Preterm births and viral suppression rates were the only endpoints with a significant difference between treatments. The odds of viral suppression were almost 3 times higher in women using DTG (OR: 2.90, 95% CI:1.54, 5.46). The risk of preterm births was 4% higher in women using EFV (RD: -0.04, 95% CI:-0.07, -0.00). Interestingly, no significant difference was found between the treatments regarding the number of MTCTs. Two cases were reported in IMPAACT 2010 and three cases in DOLPHIN-2, all occurring in the DTG-arms. As viral suppression rates were significantly lower with EFV, a significantly higher number of MTCTs had been expected with EFV use.



[Table. Proportion of stillbirths, neonatal deaths, MTCT and viral suppression]

CONCLUSIONS: Greater and faster rates of viral suppression were seen in pregnant women who used DTG over EFV but, all five cases of HIV MTCT occurred in the DTG-arms, versus none in the EFV-arms. There was minimal difference between the safety of the treatments. These results should be confirmed in larger studies with longer-term follow-up.

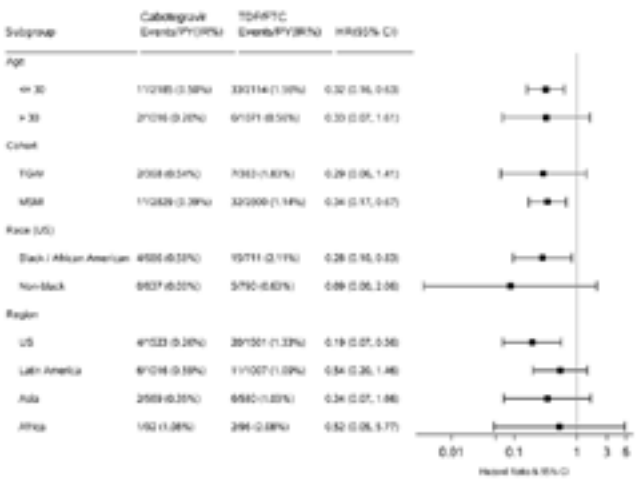
BACKGROUND: HPTN 083 is a phase 2b/3 randomized multicenter double-blind, double-dummy clinical trial of long-acting cabotegravir (CAB) compared to daily oral TDF/FTC for HIV PrEP; primary results have been presented. In this analysis we compare HIV incidence and efficacy of CAB-LA versus TDF/FTC in targeted subpopulations.

METHODS: HIV-negative cisgender men who have sex with men (MSM) and transgender women (TGW) who have sex with men at increased HIV risk were randomized 1:1 to either active CAB + placebo TDF/FTC or active TDF/FTC + placebo CAB. Participants were offered open-label daily oral TDF/FTC after their last injection. Enrollment

was pre-specified to include at least: 50% participants under age 30; 10% TGW; and 50% Black in the United States (US). Hazard ratios (HR) were estimated using Cox proportional hazard models.

RESULTS: Of the 4566 participants enrolled, 67% were < 30 years, 12% were TGW, 50% of the US population was Black. Fifty-two incident HIV infections were observed, 44 among participants < 30 years old (11 in the CAB-LA arm versus 33 in the TDF/FTC arm; HR: 0.32, 95%CI: 0.16, 0.63). Nine infections were observed among TGW, 2 in the CAB-LA arm and 7 in the TDF/FTC arm (HR 0.29, 95% CI: 0.06,1.41). Among Black US participants, 4 infections were observed in the CAB-LA arm versus 15 in the TDF/FTC arm (HR 0.28, 95%CI:0.10,0.83). Across regions, the HR (CAB-LA vs TDF/FTC) varied from 0.19 (95% CI:0.07,0.56) in the US to 0.54 (95% CI: 0.20,1.46) in Latin America (Figure).



[Figure]

CONCLUSIONS: HPTN 083 is the first study demonstrating efficacy for a long-acting PrEP agent. Pre-specified key subpopulations historically underrepresented in PrEP registrational trials were successfully enrolled and retained, fostering inclusion and equity in scientific development. CAB provided estimates of high levels of protection regardless of gender, region, or age.

HIV INFECTION AND UNSAFE INJECTION PRACTICE AMONG CHILDREN IN SINDH, PAKISTAN: A CASE-CONTROL STUDY OF AN OUTBREAK

F. Mir[1], V. Simms[2], S.F. Mahmood[3], S.H. Abidi[4], A.A. Nathwani[5], S.A. Shaikh[6], B. Achakzai[7], Q. Saeed[7], P. Khan[2], H. Weiss[2], R.A. Ferrand[8]
[1]The Aga Khan University, Section Pediatric Infectious Disease, Pediatrics and Child Health, The Aga Khan University, Karachi, Pakistan, [2]London School of Hygiene & Tropical Medicine, Infectious Disease Epidemiology, London, United Kingdom, [3]The Aga Khan University, Section Infectious Disease, Medicine, Karachi, Pakistan, [4]The Aga Khan University, Department of Basic and Biological Sciences, Karachi, Pakistan, [5]The Aga Khan University, Pediatrics and Child Health, Karachi, Pakistan, [6]Ministry of Health, Sindh, Sindh AIDS Control Programme, Karachi, Pakistan, [7]National AIDS Control Program, Islamabad, Pakistan, [8]London School of Hygiene & Tropical Medicine, Clinical Research, London, United Kingdom

BACKGROUND: An HIV outbreak unfolded in Larkana District, Sindh, Pakistan in April 2019. By December 2019, 1167 children had tested positive for HIV. Our study evaluates risk factors for HIV in this population.

METHODS: We conducted a household-based, individually-matched case-control study. Cases (children aged <16 years registered for pediatric HIV care in Larkana City) and controls (HIV-uninfected children matched 1:1 by age, sex and neighbourhood) were sampled concurrently. Serum was collected from all participants for hepatitis B and C serology. Mothers of all participants were tested for HIV. Adjusted odds ratios (aOR) were estimated using conditional logistic regression to assess factors associated with HIV infection.

RESULTS: From 3 July to 26 December 2019, 403 HIV cases and 403 individually-matched controls were recruited. Prevalence of HBV surface antigen and HCV antibodies were 18.4% (95% CI 14.7-22.5) and 6.5% (95% CI 4.3-9.3) respectively among cases, and 5.2% (3.3-7.9) and 1.0% (0.3-2.5) respectively among controls. Only 7.0% of cases had HIV positive mothers. In the 6 months prior to HIV testing, 228 (56.6%) cases and 32 (7.9%) controls reported >10 injections, and 294 (72.7%) cases and 78 (19.3%) controls had received an infusion. At least one blood transfusion was reported in 56 (13.9%) cases and 3 (0.7%) controls. HIV infection was independently associated with mother's occupation, history of blood transfusion (aOR 115.6, 95%CI 6.4-2091), and history of more injections/infusions (aOR 1.5, 95%CI 1.2-1.9), more than 1 visit to a government hospital (aOR19.9, 95%CI 2.6-155.2), and more visits to private clinics (aOR 3.1, 95%CI 1.9-5.2) in the 6 months prior to HIV testing.

CONCLUSIONS: HIV infection was associated with blood transfusion, multiple recent injections or infusions, and more visits to healthcare facilities in this population. This establishes that the most likely mode of transmission in this outbreak was parenteral (unsafe injection).
Funding Department of Pediatrics and Child Health, the Aga Khan University, Karachi

IMPACT OF PHYSICAL DISTANCING DUE TO COVID-19 ON HIV PRE-EXPOSURE PROPHYLAXIS (PREP) USE AND SEXUAL BEHAVIOUR AMONG GAY AND BISEXUAL MEN IN AUSTRALIA: IMPLICATIONS FOR TRENDS IN HIV AND OTHER SEXUALLY TRANSMISSIBLE INFECTIONS

M. Hammoud[1], A. Grulich[1], L. Maher[1], M. Holt[2], L. Degenhardt[3], F. Jin[1], D. Murphy[1], B. Bavinton[1], T. Lea[2], B. Haire[1], A. Bourne[4], P. Saxton[5], S. Vaccher[1], J. Ellard[6], B. Mackie[7], C. Batrouney[8], N. Bath[9], G. Prestage[1]
[1]University of New South Wales (UNSW), Kirby Institute, Sydney, Australia, [2]University of New South Wales (UNSW), Centre for Social Research in Health, Sydney, Australia, [3]University of New South Wales (UNSW), National Drug and Alcohol Research Centre (NDARC), Sydney, Australia, [4]La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia, [5]University of Auckland., Department of Social and Community Health, School of Population Health, Auckland, New Zealand, [6]Australian Federation of AIDS Organisations (AFAO), Australian Federation of AIDS Organisations (AFAO), Sydney, Australia, [7]ACON Health, ACON Health, Sydney, Australia, [8]Thorne Harbour Health, Thorne Harbour Health, Melbourne, Australia, [9]National LGBTI Health Alliance, National LGBTI Health Alliance, Sydney, Australia

BACKGROUND: In late-March 2020, Australian state and federal governments introduced physical distancing measures to combat COVID-19. We investigated the impact of physical distancing measures on HIV pre-exposure prophylaxis (PrEP) use and sexual behaviour among gay and bisexual men (GBM) in Australia.

METHODS: In April 2020, 940 participants in an ongoing cohort study responded to questions about COVID-19 and changes in PrEP use and sexual behaviours before and following enactment of physical distancing measures.

RESULTS: Mean age was 43.9 years (SD: 13.4). Among the 664 men who reported sex with either fuckbuddies or casual partners, 82.8% had ceased sex with those partners entirely following COVID-19 and

the average number of partners per day decreased from 0.089 (SD: 0.144) to 0.031 (SD: 0.097; p<0.001), representing a reduction of 65.2%. Among non-HIV positive GBM, 48.2% reported PrEP use prior to COVID-19 physical distancing measures. Among those, 58.4% continued to use PrEP and 41.6% ceased use since physical distancing restrictions were imposed. Men who ceased PrEP use were more likely to cease having sex with casual partners (90.8% vs 74.8%; p<0.001) and with fuckbuddies (88.2% vs 64.4%; p<0.001).

Most (86.0%) indicated that the reason for their cessation of PrEP use was 'I'm not having sex' but 17.0% also indicated that they had found it more difficult to access PrEP during social distancing restrictions.

CONCLUSIONS: The dramatic decreases in PrEP use and sexual activity observed in these data will likely result in short-term reductions in new HIV and sexually transmissible infections diagnoses in the short term, but they may be transient as COVID-19 physical distancing restrictions are eased, and reinstated, over time. These dramatic reductions in sexual activity may be difficult to sustain throughout physical distancing restrictions.

On-demand PrEP messaging could be usefully deployed to GBM who have ceased their PrEP use during physical distancing measures. The possibility of continued non-use of PrEP, or lack of preparedness for recommencement of PrEP when physical distancing measures eventually ease may lead to short term increases in HIV infections. Policy responses and harm reduction interventions will need to be appropriately targeted as GBM engage with a 'new normal'.

OACLB0104

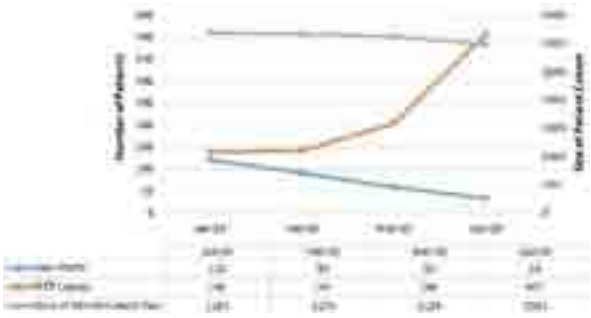
IMPACT OF COVID-19 ON HIV PREEXPOSURE PROPHYLAXIS CARE AT A BOSTON COMMUNITY HEALTH CENTER

D. Krakower[1], P. Solleveld[1], K. Levine[2], K. Mayer[2]
[1]Beth Israel Deaconess Medical Center, Boston, United States, [2]The Fenway Institute, Boston, United States

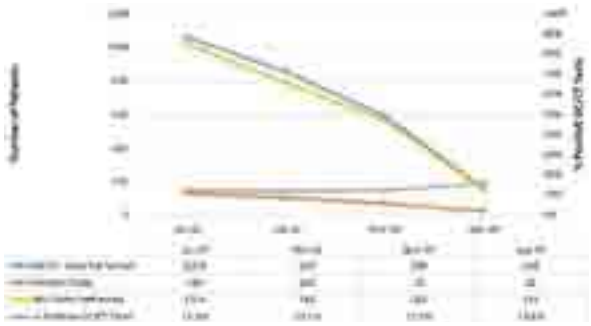
BACKGROUND: COVID-19 has impeded healthcare in the US since March 2020. We described the impact of COVID-19 on HIV preexposure prophylaxis (PrEP) care at a Boston community health center specializing in sexual healthcare.

METHODS: We extracted electronic healthcare data for patients with at least one active PrEP prescription during January-April 2020. We described trends in PrEP initiations and refill lapses (i.e., lack of refill before end of prior prescription), testing for gonorrhea/chlamydia (GC/CT) and HIV, and telehealth. We assessed covariates associated with refill lapses in April 2020 using chi-squared tests.

RESULTS: Of 3520 PrEP patients, the mean (SD) age was 36.9 (11.2), 72.7% were white, 13.6% Latinx, 92.1% cisgender men and 12.9% publically insured. From January to April, PrEP initiations decreased by 72.1% (122/month to 34/month), refill lapses increased by 278% (140/month to 407/month), and the number of PrEP patients decreased by 17.9% (Figure 1). GC/CT and HIV tests each decreased by 85.1% (1058/month to 158/month for GC/CT and 1014/month to 151/month for HIV), while GC/CT test positivity rates increased slightly (12.3% to 15.8%; Figure 2); the only HIV diagnosis among PrEP patients was in January. Clinical encounters decreased by 26.3% (1419 to 1046) and transitioned from 0% to 97.7% telehealth. Refill lapses were associated with being ≤26y (p=0.001), non-white (p=0.001), Latinx (p=0.049), and publically insured (p=0.002).



[Figure 1. Changes in PrEP use before and during Covid-19]



[Figure 2. Changes in GC/CT and HIV testing before and during Covid-19]

CONCLUSIONS: COVID-19 was associated with disruptions in PrEP care, especially among vulnerable subpopulations, despite high use of telehealth. Studies to understand whether changes in PrEP care reflect decreased sexual risk or barriers to optimal healthcare are needed.

OACLB0105

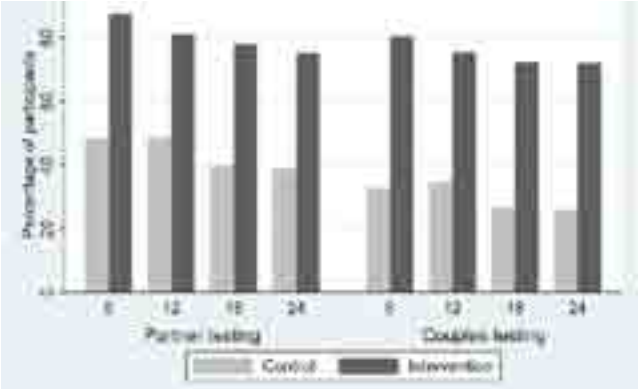
CLUSTER RANDOMIZED TRIAL OF AN HIV SELF-TESTING INTERVENTION TO PROMOTE PARTNER TESTING AND SAFER SEXUAL BEHAVIOR AMONG WOMEN AT HIGH RISK OF HIV INFECTION IN KENYA

H. Thirumurthy[1], E. Bair[1], P. Ochwal[2], N. Marcus[1], S. Maman[3], S. Napierala[4], K. Agot[2]
[1]Perelman School of Medicine, University of Pennsylvania, Department of Medical Ethics and Health Policy, Philadelphia, United States, [2]Impact Research and Development Organization, Kisumu, Kenya, [3]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [4]RTI International, Women's Global Health Imperative, Berkeley, United States

BACKGROUND: HIV self-testing (HIVST) can overcome barriers to HIV testing, but its potential as an HIV prevention strategy for women in sub-Saharan Africa has not been assessed. We examined whether provision of multiple self-tests to high-risk women promotes partner testing, facilitates safer sexual behavior, and reduces HIV risk (NCT03135067).

METHODS: Between 2017-2018, we recruited 2,090 HIV-negative women ≥18 years with ≥2 partners from 66 clusters in Siaya County, Kenya including beach communities and sex worker hotspots. In clusters randomized to the intervention, participants received self-tests at regular intervals during the study. In control clusters, participants received referral cards for facility-based testing. Follow-up visits occurred at 6-month intervals, for up to 24 months, and concluded in March 2020. HIV incidence, partner testing, couples testing, HIV-positive partners identified, and sexual behavior were compared between study groups.

RESULTS: Participants' mean age was 27.1 years, 64.5% were married, and 66.6% reported sex work as an income source. Mean follow-up duration was 19.1 months. Intervention participants received an average of 16.8 self-tests. HIV incidence did not differ between the intervention and control groups (1.2 vs. 1.0 per person-year, HR 1.17; 95% CI 0.54, 2.51; p=0.69). At each follow-up, the intervention significantly increased primary partner and couples testing in the past 6 months (Figure). The intervention also identified 1.79 times more HIV-positive sexual partners per participant (p<0.001). At 6 months, intervention participants were more likely to report that condom use resulted from ≥1 partners testing HIV-positive or declining testing (11.6% vs. 6.2%; p<0.001); however, this difference did not persist at 12-24 months.



[Figure. Primary partner and couples testing in past 6 months
Reported by participants at each 6-months follow-up visit]

CONCLUSIONS: Provision of multiple self-tests to high-risk women in Kenya led to increased awareness of sexual partners' HIV status and modestly safer sexual behavior, but did not affect HIV incidence.
This approach can support achievement of UNAIDS 95-95-95 targets and should be accompanied with additional HIV prevention interventions.

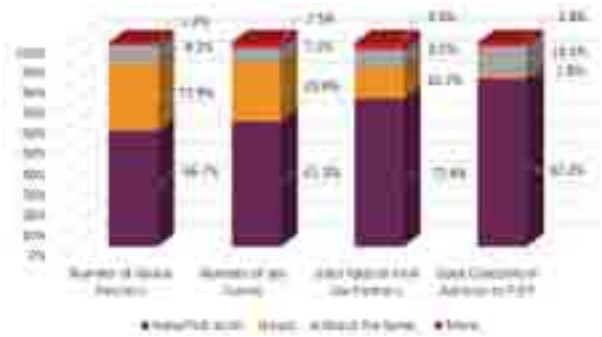
IMPACT OF COVID-19 RELATED SHELTER-IN-PLACE ORDERS ON PREP ACCESS, USAGE AND HIV RISK BEHAVIORS IN THE UNITED STATES

S. Brawley[1], J. Dinger[2], C. Nguyen[3], J. Anderson[3]
[1]American Academy of HIV Medicine, Policy and Programs, Washington, United States, [2]University of California San Francisco, School of Pharmacy, San Francisco, United States, [3]Gilead Sciences, Medical Affairs, Foster City, United States

BACKGROUND: In 2020, USA implemented shelter-in-place orders (SIPOs) during the COVID-19 outbreak. These orders led to reduced staff and hours or completely closed healthcare facilities. We sought to understand how SIPOs impacted PrEP access, use, and HIV risk behaviors among PrEP users or modified PrEP providers' practice to understand how SIPOs may impact the future of PrEP delivery.
METHODS: Electronic convenience sample surveys of PrEP users and prescribers were simultaneously deployed across a 25-day period at the height of SIPO implementation. PrEP user survey link was sent via social media and PrEP advocates. The provider survey link was emailed to more than 2500 providers from the Academy's database. Summary analysis of cohort groups for insights and trends
RESULTS: 409 PrEP users under SIPOs responded, approximately 33% reported discontinuing PrEP. Many discontinued users (83%) stopped voluntarily and of those, 85% due to low perceived HIV risk, with only 11 participants citing inability to access PrEP medications. Post-SIPO HIV risk varied among respondents (Figure 1.) Of 189 prescribers, 95% reported being able to prescribe PrEP during SIPOs despite >90% reporting practice-site restrictions. While some PrEP users discontinued PrEP, among providers: 90% recommended no PrEP regimen changes to patients; 68% implemented telemedicine practices; and 59% indicated refilling PrEP medications while postponing routine HIV/STI and laboratory tests to be completed as soon as possible; 15% opted to completely forgo testing and lab monitoring. One in five providers encountered PrEP users with suspected STIs for which they could not obtain a test and half (47%) elected to treat empirically.



[Figure 1. Changes to risk taking behaviors after SIPO/SAHO]

CONCLUSIONS: During USA SIPOs, PrEP users were able to access PrEP via telemedicine while some discontinued due to perceived low HIV risk and self-reported reduced risk behaviors. Despite in-person visits being limited, providers were able to prescribe PrEP, however, PrEP users had limited access to HIV/STI testing.

OADLB0102

EXPERIENCES OF PARTICIPANTS IN A DECENTRALIZED HIV MEDICATION DISTRIBUTION PROGRAM IN SOUTH AFRICA DURING THE COVID-19 PANDEMIC

J. Jarolimova[1,2], B. Bunda[2], S. Govere[3], N. Wara[2], L. Bogart[4], H. Thulare[3], R. Parker[5,6,7], I. Bassett[1,2,6,7]
[1]Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, [2]Massachusetts General Hospital, Medical Practice Evaluation Center, Boston, United States, [3]AIDS Healthcare Foundation, Durban, South Africa, [4]RAND Corporation, Santa Monica, United States, [5]Massachusetts General Hospital, Biostatistics Center, Boston, United States, [6]Harvard University, Center for AIDS Research (CFAR), Boston, United States, [7]Harvard Medical School, Boston, United States

BACKGROUND: Restrictions on social interaction and mobility during the COVID-19 pandemic could adversely impact long-term HIV care, particularly in areas of high HIV prevalence such as South Africa. De-centralized antiretroviral therapy (ART) programs, which allow stable patients to collect ART at community-based pick-up points, have the potential to improve care by decongesting clinics and decreasing barriers to ART access. We aimed to evaluate the experiences of people receiving HIV care through a decentralized program in South Africa during the COVID-19 pandemic.

METHODS: We telephoned a random subsample of 604 participants enrolled in a larger prospective cohort study of the Central Chronic Medicine Dispensing and Distribution Program (CCMDD) in urban Kwazulu-Natal. A semi-structured telephone interview included questions about general concerns regarding the COVID-19 pandemic and national lockdown, and changes in access to HIV care and ART.

RESULTS: We completed interviews with 280 participants (46%) of whom 66% were female, median age was 37y, and median time of enrollment in the CCMDD program was 6.7 months. The most common concern among participants regarding the COVID-19 pandemic was food running out, cited by 113 (40%) of participants, followed by becoming infected (n = 99; 35%), being unable to work (n = 85, 30%), and money running out (n= 80; 29%). Primary concerns regarding ART pick-up in the future were COVID-19 infection risk (91, 33%), transportation availability (63, 22%), and safety (58, 21%). Twenty (7%) of 278 participants had recently delayed picking up their ART due to COVID-19. Among those with available data, 40 (30% of 143) reported an increase in time to travel to their medication pick-up point, and 71 (49% of 144) reported an increase in wait-times.

CONCLUSIONS: Participants in a decentralized ART program in South Africa identified socioeconomic concerns and fear of COVID-19 infection during the national lockdown for COVID-19 mitigation. While a small number had delayed picking up ART due to COVID-19, a significant proportion had concerns about accessibility and safety of medication pick-up going forward, and many reported new barriers to picking up their medication. Strategies for maintaining access to longitudinal HIV care during the COVID-19 pandemic in South Africa are needed.

OADLB0103

SAFETY AND PRELIMINARY EFFECTIVENESS OF THE TU'WASHINDI INTERVENTION TO INCREASE PREP USE AMONG KENYAN ADOLESCENT GIRLS AND YOUNG WOMEN AT RISK OF INTIMATE PARTNER VIOLENCE: A PILOT CLUSTER-RANDOMIZED CONTROLLED TRIAL

S.T. Roberts[1], E.N. Browne[1], A.M. Minnis[1], M. Hartmann[1], S. Otticha[2], E.T. Montgomery[1], S. Ohaga[2], K. Agot[2]
[1]RTI International, Women's Global Health Imperative, Berkeley, United States, [2]Impact Research and Development Organization, Kisumu, Kenya

BACKGROUND: Oral pre-exposure prophylaxis (PrEP) has potential to reduce HIV acquisition among adolescent girls and young women (AGYW) in sub-Saharan Africa, a priority population for epidemic control. However, intimate partner violence (IPV) and low relationship power may create significant challenges to PrEP use. The Tu'Washindi intervention aimed to increase PrEP uptake and adherence among AGYW enrolled in the DREAMS Initiative in Siaya County, Kenya, where IPV and gender inequity are highly prevalent.

METHODS: Our multi-level, community-based intervention was piloted in a cluster-randomized controlled trial conducted at 6 pair-matched DREAMS Safe Spaces. Three intervention components were delivered over 6 months: an 8-session empowerment-based support club, community sensitization targeted towards male partners, and a couples' PrEP education event. Participants were ages 17-24, HIV-uninfected, and either eligible for, or already taking, PrEP. PrEP uptake and IPV were assessed over 6 months of follow-up through interviewer-administered questionnaires, and adherence was assessed with Wisepill electronic monitoring devices. PrEP uptake, adherence and IPV were compared using Poisson and negative binomial regression models adjusting for matched sites.

RESULTS: We enrolled 103 AGYW; median age was 22 years (IQR 20-23), 95% had a primary partner, 32% were currently taking PrEP, and 44% reported IPV in the past 3 months. Retention was 97% at Month 6. Compared to control arm participants, those in the intervention arm were more likely to initiate PrEP, if not already using it at enrollment (68% vs. 32%, aRR 2.28, 95% CI 1.19-4.38, p=0.01), and those taking PrEP had higher adherence (25% vs.13%, aRR 1.86, 95% CI 1.10-3.13, p=0.02). Twenty percent of participants reported IPV during study follow-up. There were trends towards fewer IPV events per participant (aRR 0.62, 95% CI 0.24-1.57, p=0.31) and fewer events resulting in injury (aRR 0.22, 95% CI 0.05-1.06, p=0.06) in the intervention versus control arm.

CONCLUSIONS: Tu'Washindi shows promise in promoting PrEP uptake and adherence among AGYW without concomitant increases in IPV, however adherence was still suboptimal. Further research is needed to determine whether these gains translate to increases in the proportion of AGYW with protective levels of PrEP adherence and to evaluate the potential for the intervention to reduce IPV risk.

OADLB0104

EFFECTIVENESS OF THE SISTA2SISTA PROGRAM ON IMPROVING HIV AND OTHER SEXUAL AND REPRODUCTIVE HEALTH OUTCOMES AMONG VULNERABLE ADOLESCENT GIRLS AND YOUNG WOMEN IN ZIMBABWE

G. Oberth[1], T. Chinhengo[2], T. Katsande[3], R. Mhonde[3], P. Kasere[3], B. Chihumela[3], D. Hanisch[3], B. Madzima[4]
[1]University of Cape Town, Center for Social Science Research, Cape Town, South Africa, [2]United Nations Population Fund (UNFPA), East and Southern Africa Regional Office, Johannesburg, South Africa, [3]United Nations Population Fund (UNFPA), Harare, Zimbabwe, [4]Ministry of Health and Child Care, Harare, Zimbabwe

BACKGROUND: In Zimbabwe, adolescent girls and young women (AGYW) experience high rates of HIV infection, gender-based violence, and other sexual and reproductive health challenges. They also face barriers to accessing health information, services and support. In 2013, the Ministry of Health and Child Care partnered with the United Nations Population Fund to design and implement the Sista2Sista program. Sista2Sista is a structured peer group behavioral intervention aimed at improving health outcomes among vulnerable in- and out-of-school AGYW.

METHODS: Program data was analyzed for 91,612 AGYW aged 10-24 years who were enrolled in the Sista2Sista program in Zimbabwe between 2013 and 2019. Logistic regression was used to determine odds ratios (OR) with 95% confidence intervals (CI) and evaluate Sists2Sista program exposure as a factor in the following variables, defined a priori: HIV testing, marriage, school attendance, family planning, pregnancy and reported sexual abuse.

RESULTS: A total of 58,471 AGYW (63.82%) graduated from the Sista-2Sista program by completing at least 30 out of 40 exercises. Compared to those with fewer than 30 exercises, graduates were more likely to take an HIV test (2.78 OR 95% CI 2.52-3.10), less likely to get married (0.63 OR 95% CI 0.55-0.73) and less likely to drop out of school (0.60 OR 95% CI 0.53-0.69). At higher thresholds of program completion, additional positive outcomes were observed. Participants who completed all 40 exercises were more likely to go back to school (1.41 OR 95% CI 1.18-1.69), report the use a family planning method (1.38

OR 95% CI 1.21-1.56), and come forward to report sexual abuse (1.76 OR 95% CI 1.17-2.66). They were also less likely to become pregnant as adolescents (0.41 OR 95% CI 0.24-0.72). Participants who benefited from individual counselling sessions were more likely to graduate from the program.

CONCLUSIONS: The Sista2Sista program had a positive effect on a range of HIV and other sexual and reproductive health outcomes among vulnerable AGYW in Zimbabwe. Strategies to retain participants in the program for longer should be explored. These might include layering structural elements into the program (e.g. school support) as well as intensifying individual counselling.

OADLB0105

THE #STAYHOME #SELFTEST CAMPAIGN. RAPID PIVOT OF HIV TESTING SERVICES TO ENABLE CONTINUITY OF CARE IN HANOI, VIETNAM DURING THE COVID-19 LOCK-DOWN

K. Green[1], T. Thi Tran[1], M.T. Le[2], H. Ha[3], T. Tan Nguyen[4], B. Vu Ngoc[1], D. Hong Anh[1], S. Vo Hai[5], A. Khanh Tran[1], H. Thai Nguyen[1], T. Phan Minh[1], T. Ngo Minh[6]

[1]PATH, Hanoi, Vietnam, [2]Glink, Hanoi, Vietnam, [3]National MSM & TG Network, Hanoi, Vietnam, [4]My Home, Ho Chi Minh City, Vietnam, [5]Vietnam Administration of HIV/AIDS Control, Hanoi, Vietnam, [6]USAID, Hanoi, Vietnam

BACKGROUND: With SARS-CoV-2 transmission on the rise in Hanoi, Vietnam in late March, facility-and community-based HIV testing was largely halted through most of April. Even before restrictions were put in place, the number of individuals seeking an HIV test declined through March. Leading up to COVID-19, differentiated HIV testing options were available to key populations (KP), such as self-testing (HIVST), lay-testing, and facility-based testing. Both blood-based and oral fluid HIVST are available in Vietnam.

DESCRIPTION: Starting in April, KP-led organizations, private clinic partners, and the USAID/PATH Healthy Markets project crowd-sourced ideas from KP for re-framing HIV testing during COVID-19. The resulting "#Stayhome #Selftest" campaign offered KP the option to place an order for an HIV self-test kit by phone, text, or an online ordering platform. An online risk screening tool further guided individuals in self-determining their need for an HIVST. HIVST kits were delivered using local courier options (e.g. Grab), post, or home drop-off depending on client preference and location, while applying a universal mask use policy.

LESSONS LEARNED: The coordinated effort to offer HIVST through online orders and home-delivery resulted in 877 HIVST kits being couriered, posted, or otherwise delivered to those seeking an HIV test in Hanoi in April. This reflected a 97% increase in the monthly average number of HIVST kits that were distributed in the three previous months. The majority of those ordering a test were young men who have sex with men between the ages of 19-24, of whom 28% had never tested for HIV before, and 85% of whom said it was online content that prompted them to seek an HIV test.

CONCLUSIONS/NEXT STEPS: HIVST is an empowering self-care tool, allowing individuals to seek an HIV test based on their own assessment of risk and need. It also provides testing options for those who may be reluctant to go to a clinic for an HIV test due to COVID-19. Increasing access to HIV self-testing during and after the COVID-19 lock-down is an essential measure to ensure that those at risk of HIV, including those who have never tested for HIV before, have continued access to COVID-19 safe HIV testing.

CONTINUITY OF ART PROVISION DURING COVID-19 LOCKDOWN, A TASO MASAKA COMMUNITY ART DELIVERY EXPERIENCE

I. Magala[1], E. Muwanga[2]

[1]The AIDS Support Organization, Community systems and Linkages, Kampala, Uganda, [2]The AIDS Support Organisation, Pyscho-social, Kampala, Uganda

BACKGROUND: TASO Masaka has 8020 ART clients in care of which 65% of these receive their drugs through the community arm of drug distribution. The outbreak of COVID -19 in Uganda with now 55 cases recorded has come with preventive measures to reduce transmissions. These include social distancing and lockdown where movement from one place to another is restricted to a few professionals hence affecting ART clients who seek ART care at TASO Masaka. The procedures of obtaining travel permits are cumbersome given that one must seek approval from the Resident District Commissioners office which is far away for most clients given the geographical scope of the district. It is against such a background that TASO Masaka developed community strategies of reaching out its clients amidst the lock down.

DESCRIPTION: Monitoring and evaluation department classified clients based on ART delivery models, for clients receiving drugs in Community drug distribution points the group leaders were called and ensured that drugs were to be delivered while maintaining social distancing measures.

Those receiving drugs at facility and leave far away from the centre, the Monitoring and evaluation team had to cluster clients based on their sub counties, parishes and villages.

The list is shared with the phyco-social department for follow up, files are retrieved and phone calls are made to schedule appointments for ART delivery. This can be at home or near by agreed central location where clients can receive drugs.

For clients outside the catchment areas appropriate referrals are made to near by health centers and updating of client's records is done at the parent facility.

LESSONS LEARNED: During the lockdown clients have had uninterrupted drugs refills in their communities.

Referrals to near by health facilities have enabled continued adherence to ART among clients.

New community structures are emerging for those clients who were receiving drugs at facility.

CONCLUSIONS/NEXT STEPS: A community ART delivery approach has enabled service providers to continually provide care to clients amidst COVID Lock down.

The created community structures can be maintained to handle ART delivery during complicated situations.

OAELB0102

TWENTY-FOUR MONTH RETENTION AND VIRAL LOAD OUTCOMES FROM A NON-INFERIORITY CLUSTER RANDOMIZED TRIAL OF EXTENDING ART DISPENSING INTERVALS TO 6-MONTHLY IN ADHERENCE CLUBS

T. Cassidy[1,2], C. Keene[1], K. Lebelo[1], A. Grimsrud[3], B. Sibanda[4], S. Ndlovu[4], H. Hayes[5], C. Orrell[6,7], E. Roberts[5], N. Zokufa[1], T. Mutseyekwa[1], J. Voget[5], R. Gerstenhaber[4], L. Wilkinson[8]
[1]Medecins Sans Frontieres, Khayelitsha, Cape Town, South Africa, [2]University of Cape Town, Division of Public Health Medicine, Cape Town, South Africa, [3]Internation AIDS Society, Cape Town, South Africa, [4]Medecins Sans Frontieres, Cape Town, Cape Town, South Africa, [5]Western Cape Provincial Department of Health, Cape Town, South Africa, [6]University of Cape Town, Department of Medicine, Cape Town, South Africa, [7]University of Cape Town, The Desmond Tutu HIV Centre, Cape Town, South Africa, [8]University of Cape Town, Center of Infectious Diseases and Epidemiological Research, Cape Town, South Africa

BACKGROUND: Patients and health systems could benefit from reduced visit frequency by increasing ART refills. Antiretroviral therapy (ART) adherence clubs (AC) support clinically stable patients' retention through lay healthcare worker-led group ART refills and psychosocial support. We conducted a non-inferiority cluster randomized control trial comparing standard of care (SoC) ACs and 6-month refill intervention ACs in Khayelitsha, South Africa.

METHODS: Existing ACs were randomized to either SoC or intervention ACs. SoC ACs met five times annually receiving 2-month refills with a 4-month refill over year-end; one AC visit included an annual blood draw followed by clinical assessment at the next visit. Intervention ACs met twice annually receiving 6-month refills, with an individual blood collection anytime 3-30 days before the annual clinical assessment AC visit. Study enrolment took place in 2017 with the first study visits in October/November 2017 and patients followed for 24-months. Retention was defined as a visit on or within 3-months after the 24-month scheduled appointment. Viral load (VL) completion (12-24 months after enrolment) and suppression(<400copies/mL) at analysis closure are presented by group. We conducted a Cox proportional hazards regression analysis to compare attrition (death or loss to follow-up) using robust standard errors to account for clustering.

RESULTS: A total of 2,150 patients in 88 ACs were included; 977 in 40 intervention ACs (22% male) and 1,173 in 48 SoC ACs (24% male). Twenty-four month retention was high in both arms; 93.1% (95% CI: 91.2-94.7%) in intervention ACs and 94.0% (95% CI:92.4-95.2%) in SoC ACs, with no significant difference between groups (Hazard Ratio 1.09, 95% CI: 0.54-2.19). Among those retained at 24 months, viral load completion was slightly higher in the intervention arm (848/897;94.5% [CI:92.9-95.8%] vs. 972/1089;89.3% [CI:85.6-92.1%]) and suppression was similar between arms (817/848; 96.3% [95%CI: 94.6-97.5%] vs. 948/972; 97.5%[95%CI: 96.4-98.3%]).

CONCLUSIONS: After 24-months, non-inferior retention and viral load outcomes were observed between the intervention ACs with 6-month ART refills and the SoC ACs. These findings are consistent with the 12-month outcomes and provider further reassurance that clinically stable patients can achieve good outcomes with fewer ART visits and longer ART refills.

OAELB0103

SWING-LED EFFORT TO SUSTAIN ESSENTIAL NEEDS AND HIV SERVICES OF VULNERABLE SEX WORKERS IN THAILAND THROUGH COVID-19 PANDEMIC

S. Janyam[1], C. Phaengnongyang[1], N. Pungpapong[2], R. Vannakit[3], N. Rittiwong[1], S. Sukthongsa[1], S. Sumalu[1], D. Phuengsamran[4], C. Songsamphan[5]
[1]SWING Foundation, Bangkok, Thailand, [2]Winchester College, Winchester, United Kingdom, [3]Independent Researcher, Bangkok, Thailand, [4]Mahidol University, Nakhonpathom, Thailand, [5]Thammasat University, Bangkok, Thailand

BACKGROUND: Around 200,000 sex workers in Thailand immediately became jobless due to COVID-19 public health measures. Sex workers could not access the government's financial aid for informal workers as their job is deemed non-existent/illegal. We described how an agile community-led effort has enabled sex workers in Thailand to access essential needs and HIV services during the pandemic.

DESCRIPTION: SWING, a sex worker-led organisation, empowers the lives of sex workers through health, educational, and legal support. SWING staff are current/ex-sex workers trained to be lay providers delivering HIV services to their peers. COVID-19 enthused these lay providers to cook and deliver meals to sex workers and their families. The "COVID-19 Fund for Sex Workers" was rapidly set up asking for money and essential supply donations to provide immediate support to sex workers in Bangkok and Pattaya.

LESSONS LEARNED: From April 11 to 22 May 2020, SWING received almost 2 million THB (≈62,500USD) from individuals and various industries. Over this period, SWING has provided support to 560 Thai and non-Thai sex workers (385 cis-women, 96 trans-women, 79 cis-men), aged 18-65 years, in Bangkok and Pattaya. Ready-to-eat meals and food supplies were delivered to these service workers three times a week. Over 80% of them had to rely on sex work income to support their children and families.

Temporary jobs were created for sex workers to aid other homeless people during these times. Some entertainment venues, inspired by SWING, also acted as temporary kitchens to support sex workers. A small entrepreneur group has also helped SWING to conduct crowdsourcing through the vending of SWING merchandise.

Realizing that many service workers have been struggling to continue their job during COVID-19, SWING has also organized mobile clinics to provide HIV/COVID-19 laboratory screening and referral services to these sex workers. A life-saving guide and toolkit for sex workers during COVID-19 is currently under development.

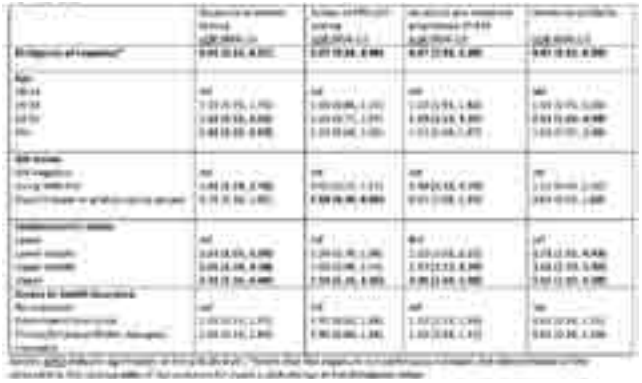
CONCLUSIONS/NEXT STEPS: Sex workers in Thailand have survived through COVID-19 pandemic due to true leadership, agility, and solidarity within their own community. Sex work has been de-stigmatized through public donation campaign which proved to fill in support gaps not covered by the Thai government.

OAELB0104

GLOBAL INTERRUPTIONS IN HIV PREVENTION AND TREATMENT SERVICES AS A RESULT OF THE RESPONSE TO COVID-19: RESULTS FROM A SOCIAL MEDIA-BASED SAMPLE OF MEN WHO HAVE SEX WITH MEN

A. Rao[1], K. Rucinski[1], B. Ackerman[2], S. Wallach[1], A. Garner[3], G.-M. Santos[4], S. Howell[3], C. Beyrer[1], S. Baral[1]
[1]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Biostatistics, Baltimore, United States, [3]Hornet, San Francisco, United States, [4]University of California, San Francisco, San Francisco, United States

BACKGROUND: Globally, the coronavirus pandemic has necessitated a range of population-based measures in order to stem the spread of infection and reduce COVID-19 morbidity and mortality. These measures may be associated with disruptions to other health services including for gay men and other men who have sex with men(MSM) at risk for or living with HIV.
Here, we assess the relationship between intensity and breadth of COVID-19 mitigation strategies and interruptions to HIV prevention and treatment services for MSM.
METHODS: Data for this study were collected as part of a COVID-19 disparities survey implemented by the gay social networking app, Hornet (16/Apr/2020-4/May/2020). Data were assessed for countries where ≥100 participants completed the survey (Brazil/France/Indonesia/Mexico/Taiwan/Turkey/UK/USA), to evaluate the association between stringency of COVID-19 mitigation strategies and HIV-service engagement (n=1929) using mixed-effects models with clustering by country. Stringency was measured using the Oxford Government Response Tracker Stringency Index; each country received a score (0-100) based on the number and strictness of nine indicators related to school and workplace closures and travel bans.
RESULTS: The median age of participants was 36(IQR:28-47); 13%(246/1929) are living with HIV. The median stringency score was 70.5(Range:[29.36,Taiwan]-[89.41,France]). For each indicator of prevention, increasing stringency of response was associated with decreased access to services. For every one-point increase in stringency, there was a 4% reduction in the odds of access to in-person testing, and a 3% reduction in the odds of access to self-testing, to PrEP, and to condoms (Table 1).



[Table 1. Factors associated with access to HIV prevention services during the coronavirus pandemic at the country- and individual-level]

Among those living with HIV, having health insurance (government (aOR: 4.86,[95%CI:1.58,14.9]); private(aOR: 4.47,[95%CI 1.45,13.8])) was independently associated with access to antiretroviral treatment.

CONCLUSIONS: More stringent government responses were associated with decreased access to HIV services. Innovative strategies, like mobile-service delivery or telehealth, may be needed to minimize the service interruptions from these types of government responses on MSM communities and ensure continuity of care.

OAELB0105

REACHING UNAIDS 95-95-95 TARGETS WORLDWIDE: PREDICTED BENEFITS AND TREATMENT COSTS WITH GENERIC MANUFACTURE

K. Heath[1], J. Levi[2], M.J. Barber[3], D. Gotham[4], A. Hill[5]
[1]Macfarlane Burnet Institute, Melbourne, Australia, [2]Homerton Hospital, London, United Kingdom, [3]Harvard T. H. Chan School of Public Health, Harvard University, Boston, United States, [4]Independent Researcher, London, United Kingdom, [5]Department of Translational Medicine, University of Liverpool, Liverpool, United Kingdom

BACKGROUND: UNAIDS aims for HIV testing, treatment and viral suppression rates to be 90%-90%-90%, respectively, by 2020 and 95%-95%-95% by 2025. Patented drug prices remain a barrier to HIV treatment. Generic alternatives are being produced and exported from countries without patent barriers at a fraction of the cost. Global access to generic alternatives could reduce expenditure and improve clinical outcomes.
METHODS: Epidemiological and demographic HIV data were compiled for 160 countries from UNAIDS, publications and country reports. The cost of generic TDF/3TC/DTG was estimated using the Panjiva database; shipment values of active pharmaceutical ingredients from India were used to estimate finished product costs, including excipient costs, tax, and 10% profit. We estimated the cost of generic drugs with (a) current, (b) 90-90-90 and (c) 95-95-95 service coverage. Weighted log-linear regression of the relationship between antiretroviral coverage and (i) HIV infections, (ii) deaths, and (iii) mother-to-child transmission (MTCT) rate was used to estimate the effects of increased service coverage. Annual antiretroviral sales were compiled from pharmaceutical quarterly financial sales reports, adjusted for inflation and GDP.
RESULTS: The estimated cost of generic TDF/3TC/DTG was $59 per person per year. The TDF component was $20, 3TC was $27 and DTG was $12. 95-95-95 generic coverage at this price would cost $2 billion annually. Estimated 2019 global HIV drug expenditure was $36.25 billion ($700 million per week).

	Service coverage		
	Current	**90-90-90**	**95-95-95**
Cost of treatment with generics in 160 countries	$1.34 billion	$1.81 billion	$2.00 billion
Number receiving ART	22.63 million	30.42 million	33.67 million
Estimated number of new infections in adults	1.16 million	0.74 million	0.68 million
Estimated number of HIV-related deaths in adults	530,000	240,000	200,000
Estimated number of mother-to-child-transmissions	179,000	71,000	58,000

[Table]

CONCLUSIONS: Reaching the UNAIDS 95-95-95 targets could prevent 480,000 new adult HIV infections, 121,000 infant HIV infections and 330,000 adult deaths per year, compared to current treatment coverage levels. The annual cost of 95-95-95 treatment coverage for the 160 countries in this study is equivalent to only three weeks of global sales at current prices; significant savings could be made by switching to quality-assured generics. Generic drug access is paramount to reduce HIV infections and deaths.

BACKGROUND: HPTN 083 is a Phase 2b/3 randomized multicenter double-blind, double-dummy, clinical trial evaluating safety and efficacy of long-acting injectable cabotegravir (CAB) compared to daily oral TDF/FTC for HIV PrEP. The blinded trial was stopped at a pre-planned interim DSMB review in May 2020.

METHODS: HIV-uninfected MSM and TGW at increased HIV risk were randomized 1:1 to either active CAB +TDF/FTC placebo (oral cabotegravir(CAB) for 5 weeks, then IM injections every 8 weeks for 148 weeks) or active TDF/FTC+CAB placebo (oral placebo for 5 weeks, then placebo injections on the same schedule). All participants were offered daily oral TDF/FTC for 48 weeks after last injection. The primary endpoints were incident HIV infection and grade 2 or higher clinical and laboratory events.

RESULTS: Participants were enrolled at 43 sites in Africa, Asia, Latin America, and the US (N=4566); median age: 26y (IQR 22-32); 12%TGW (n=567); 50% of US participants were Black (n=844). Participant retention at 6, 12, and 24 months was 91%, 87%, and 74%, respectively. Fifty-two incident HIV infections were observed over 6385 person-years, with overall HIV incidence 0.81% (95%CI 0.61-1.07); 39 infections were in the TDF/FTC arm (incidence 1.22%, 95%CI 0.87-1.67); 13 infections were in the CAB arm (incidence 0.41%, 95%CI 0.22-0.69%); HR: 0.34 (95%CI 0.18-0.62). Blinded study product injections covered 92% of person-years. Adherence to oral TDF/FTC was high; in a random subset of 372 TDF/FTC participants 87% had plasma samples with detectable concentrations, and 75% had concentrations consistent with daily dosing. CAB and TDF/FTC were both well tolerated; most adverse events were mild/moderate and balanced between arms. Injection site reactions, pyrexia, and hypertension were significantly more common in CAB participants, nausea was significantly more common in TDF/FTC participants. Injection intolerance led to discontinuation in 46 (2.2%) active CAB-LA recipients and was associated with the severity of the intolerance/reaction.

CONCLUSIONS: CAB and TDF/FTC were both safe and highly effective for PrEP in HPTN083, with estimated HIV incidence in the CAB arm 66% lower than in the TDF/FTC arm. CAB is the first injectable agent proven effective for HIV PrEP; a companion trial in cisgender women is ongoing.

OAXLB0102

UPDATE ON NEURAL TUBE DEFECTS WITH ANTIRETROVIRAL EXPOSURE IN THE TSEPAMO STUDY, BOTSWANA

R. Zash[1], L. Holmes[2], M. Diseko[3], D. Jacobson[4], G. Mayondi[3], A. Isaacson[3], S. Davey[3], J. Mabuta[3], M. Mmalane[3], T. Gaolathe[3], S. Lockman[5], J. Makhema[3], R. Shapiro[4]

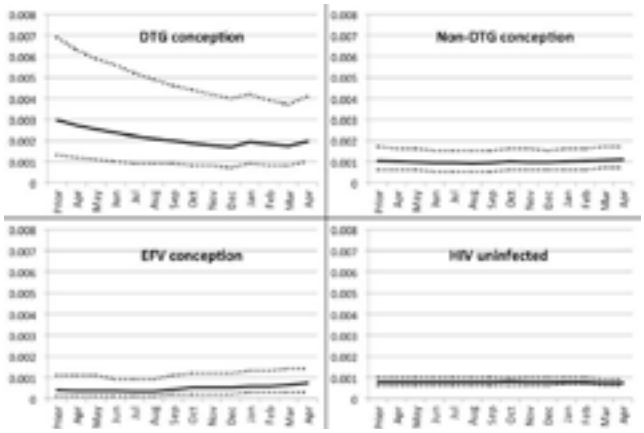
[1]Beth Israel Deaconess Medical Center, Boston, United States, [2]Mass General Hospital for Children, Boston, United States, [3]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [4]Harvard TH Chan School of Public Health, Boston, United States, [5]Brigham and Women's Hospital, Boston, United States

BACKGROUND: The Tsepamo study last reported neural tube defect (NTD) data collected through March 2019 (Zash et al, *NEJM* 2019), with 0.3% prevalence following exposure to dolutegravir at conception compared with 0.1% following exposure to non-DTG antiretrovirals at conception. The study is ongoing and data collected through April 2020 are now reported.

METHODS: The Tsepamo Study conducts birth outcomes surveillance study at government hospitals throughout Botswana, currently covering ~70% of all births. Midwives perform surface examinations of all live births and stillbirths and describe abnormalities. Research assistants photograph major abnormalities after maternal consent, which are reviewed by a birth defects expert blinded to exposures. Prevalence of NTDs was determined by maternal HIV and antiretroviral exposure status (95%CI by Wilson method) and the primary analysis evaluated prevalence differences by exposure status (95%CI by Newcombe method).

RESULTS: Since March 2019, 39,200 additional births were recorded, including 1908 additional DTG conception exposures. Since August 2014, there have been a total of 158,244 deliveries; 153,899 (97.2%) had an evaluable infant surface exam, with 126 (0.08%, 95%CI 0.07%,

0.09%) NTDs identified (83 with photo, 43 by description only). Among women on dolutegravir at conception, 7/3591 NTDs occurred (0.19%; 95%CI 0.09%, 0.40%): 3 myelomeningoceles, 1 anencephaly, 2 encephaloceles, and 1 iniencephaly. In comparison, NTDs occurred in 21/19,361 (0.11%; 95%CI 0.07%, 0.17%) women delivering on any non-dolutegravir antiretrovirals from conception, 8/10,958 (0.07%; 95%CI 0.03%, 0.17%) on efavirenz from conception, 2/4,581 (0.04%; 95%CI 0.1%, 0.16%) on dolutegravir started in pregnancy, and 87/119,630 (0.07%; 95%CI 0.06, 0.09%) HIV-uninfected women. NTD prevalence differed non-significantly between dolutegravir and any non-dolutegravir antiretrovirals from conception (0.09% difference; 95%CI -0.03%, 0.30%).



[Figure. Prevalence of neural tube defects (and 95% CI) from March 2019 - April 2020 in Tsepamo]

CONCLUSIONS: After a period of decline since the original safety signal, prevalence of NTDs among infants born to women on dolutegravir at conception may be stabilizing at approximately 2 per 1000.

OAXLB0103

COMMUNITY HIV TESTING CONTINUITY IN THE CONTEXT OF COVID-19 LOCKDOWN AND SOCIAL DISTANCING

R. Dekova[1], N. Mdluli[1]
[1]Population Services International, Health Services, Mbabane, Eswatini

BACKGROUND: Eswatini entered into a national lockdown at the end of March 2020 in response to the spread of SARS-CoV-2. Non-essential industries stopped operating, and the Ministry of Health announced a halt to community HIV testing services (those taking place outside of healthcare facilities). Focus shifted to providing HIV self-testing kits near to essential businesses, including pharmacies and food stores.
The latest data indicate that Eswatini is one of six countries who have achieved the 90-90-90 cascade goals. It is thus especially important in the country's context of a generalised epidemic to not undo this achievement. The objective of this paper is to analyse this new approach in offering HIV testing.
DESCRIPTION: PSI healthcare workers distributed oral HIV self-tests in front of food stores, pharmacies, and in their own residential communities. A risk assessment was conducted for each client, as well as screening for contacts to receive an HIV self-test. Contact details were collected from consenting clients for follow-up, where they were provided with further support and linked to HIV prevention or treatment services.
LESSONS LEARNED: Over 24 days, 7,997 HIVST kits were distributed near to pharmacies, shops and residential communities of distributors. The kits distributed were evenly split between male and female recipients. With regards to testing history, 38% of all recipients had not tested for HIV in the year prior to receiving the self-test, and 17% of recipients had never tested for HIV before. Further breakdown reveals that 56% of the recipients who had never tested for HIV prior were men, and 15% were above age 40.
CONCLUSIONS/NEXT STEPS: The advent of Covid-19 brought temporary HTS policy changes to Eswatini. The new HTS strategy had positive results, with more than half of the HIV self-tests reaching clients who had never tested before, or who had not tested in the past year, which is the guideline for testing frequency in Eswatini. Furthermore, the larger proportion of those with poor testing behaviour were men, who are a target group for HIV self-testing. Though new, this is a strategy that should continue, with more attention given to locations all over the country, for more equitable access.

OAXLB0104

THE ADVANCE TRIAL: PHASE 3, RANDOMISED COMPARISON OF TAF/FTC+DTG, TDF/FTC+DTG OR TDF/FTC/EFV FOR FIRST-LINE TREATMENT OF HIV-1 INFECTION

F. Venter[1], S. Sokhela[1], L. Fairlie[2], C. Serenata[1], N. Mashabane[1], M. Masenya[2], A. Qavi[3], K. McCann[3], B. Simmons[3], P. Clayden[4], A. Hill[5]
[1]University of the Witwatersrand, Ezintsha, Wits RHI, Johannesburg, South Africa, [2]University of the Witwatersrand, Wits RHI, Johannesburg, South Africa, [3]Imperial College London, Faculty of Medicine, London, United Kingdom, [4]HIV i-Base, London, United Kingdom, [5]Liverpool University, Department of Pharmacology, Liverpool, United Kingdom

BACKGROUND: In low- and middle-income countries, most treatment-naïve people living with HIV (PLWH) take tenofovir disoproxil fumarate (TDF) with emtricitabine FTC (or lamivudine (3TC)) and efavirenz (EFV). Dolutegravir (DTG) and tenofovir alafenamide (TAF) are recommended in international guidelines, but clinical experience with these ARVs in sub-Saharan Africa is limited. In South Africa, over 10% of patients have transmitted NNRTI drug resistance.
METHODS: We conducted a 96-week, open-label randomised trial in South Africa, comparing TAF/FTC+DTG, TDF/FTC+DTG and TDF/FTC/EFV. Inclusion criteria included age ≥12 years, no prior ART >30 days, creatinine clearance >60 mL/min (>80 mL/min if <19 years), and HIV-1 RNA >500 copies/mL. Pregnancy and tuberculosis (TB) were exclusion criteria. There was no screening for baseline drug resistance, consistent with South African treatment guidelines. The primary treatment failure endpoint was 96-week HIV-1 RNA >50 copies/mL, discontinuation or missing data (Intent-to-treat population, non-inferiority margin -10%, significance level p=0.017, adjusted for multiple comparisons). We report 96-week efficacy and safety data.
RESULTS: We randomised 1053 PLWH between February 2017 and May 2018: 99% black, 59% female, mean age 32 years, with mean CD4 336 cells/uL. At week 96, the percentage of participants with HIV RNA <50 copies/mL was 78.6% for TAF/FTC+DTG, 78.3% for TDF/FTC+DTG and 73.5% for TDF/FTC/EFV. In the on-treatment analysis, 96% of participants on TAF/FTC+DTG, 95.7% on TDF/FTC+DTG and 95.5% on TDF/FTC/EFV had HIV RNA <50 copies/mL at Week 96. Both DTG arms demonstrated non-inferior efficacy versus the EFV arm. Overall, 206/244 (84%) of treatment failures were from discontinuation. Clinical adverse events and laboratory abnormalities were similar between treatment arms.

Treatment arm	TAF/FTC+DTG	TDF/FTC+DTG	TDF/FTC/EFV
n	n=351	n=351	n=351
Week 96 Efficacy			
HIV RNA <50 copies/mL	276 (78.6%)	275(78.3%)	258 (73.5%)
HIV RNA ≥50 copies/mL	11 (3.1%)	14 (4.0%)	15 (4.3%)
Discontinuation for adverse events	2 (0.6%)	1 (0.3%)	10 (2.8%)
Discontinuation for other reasons	64 (18.2%)	62 (17.7%)	80 (22.8%)
Treatment-emergent drug resistance	0 (0.0%)	2 (0.6%)	14 (4.0%)
Female mean weight change	+8.1kg	+4.8kg	+3.2kg
Male mean weight change	+5.4kg	+3.6kg	+1.1kg
Treatment emergent obesity	47 (18%)	28 (11%)	18 (8%)
Treatment emergent metabolic syndrome	23 (8%)	16 (6%)	10 (4%)

[Table 1, ADVANCE trial results at Week 96]

CONCLUSIONS: In the ADVANCE study, TAF/FTC+DTG and TDF/FTC+DTG demonstrated non-inferior efficacy versus TDF/FTC/EFV, with low rates of virologic failure in all three arms despite country-level background NRTI/NNRTI resistance.

OAXLB0105

THE FIRST LONG-TERM REMISSION OF CHRONIC HIV-1 INFECTION WITHOUT MYELOABLATION?

R. Diaz[1], L. Giron[2], J. Galinskas[3], J. Hunter[1], S. Samer[4], D. Dias[1], L.M. Janini[3], I.L. Shytaj[5], M.C. Sucupira[1], M. Tarek[6], A. Savarino[7]
[1]UNIFESP, Infectious Diseases, Sao Paulo, Brazil, [2]Wistar Institute, Philadelphia, United States, [3]UNIFESP, Sao Paulo, Brazil, [4]Emory University/ Yerkes National Primate Research Center, Atlanta, United States, [5]Heidelberg University Hospital, Infectious Diseases, Heidelberg, Germany, [6]Armed Forces College of Medicine, Bioinformatics Department, Cairo, Egypt, [7]Italian Institute of Health, Infectious Diseases, Rome, Italy

BACKGROUND: A 34 yo Brazilian male received HIV diagnosis on October 11th, 2012. Baseline CD4+ T cell count was 372 cells/microliter and viral load (VL) was 20,221 cp/mL, suggesting chronic HIV infection. On December 12st, 2012 he started antiretroviral treatment with TDF/3TC/EFV maintaining VL below detection limits (BDL) since them. In 2016, he was enrolled in clinical trial NCT02961829 as one of five individuals under highly intensified ART (baseline ART+dolutegravir+maraviroc) and nicotinamide (500 mg twice daily) for 48 weeks. Nicotinamide (NAM) was chosen because of inhibition of immune exhaustion-related lymphocyte apoptosis related to its inhibitory effects on PARPs, and potential multiple mechanisms of antilatency such as Class III HDACs inhibition (NAM) and SUV39 Deacetylation (NAD). Maraviroc was also chosen due to potential HIV antilatency property.
METHODS: Viral DNA was measured as an estimate of the viral reservoir by published qPCR techniques. Antibody quantitation was performed using the Abbott ARCHITECT HIV Ag/Ab Combo assay (Abbott, IL, USA). Mathematical modelling performed according Conway et al., 2015.
RESULTS: Among 30 participating patients from NCT02961829, this study subject was the only experiencing viral load blips during experimental treatment, at weeks 16 (VL BDL with target detected) and 24 (56 cp/mL). Viral DNA showed low-level positivity in PBMCs and rectal biopsy at baseline and week 48. Antibody quantitation over time (RLU [S/CO] in duplicates) was 91.8 (baseline), 75.6 (week 12), 60.8 (w24), 56.8 (w36) and 58.0 (w48). In March 28th 2019, he underwent analytical treatment interruption (ATI). HIV Plasma VL performed every 3 weeks after ATI was BDL up to 57 weeks, and total HIV DNA on PBMCs was undetectable pre-ATI and 57 weeks post-ATI. EIA rapid test kit (TR DPP HIV 1/2 Bio-Manguinhos) on February 3rd 2020 was negative. Mathematical modelling (Conway et al., 2015) showed that the antiapoptotic and antiproliferative effects might improve clearance of productively infected cells, but only the additional contribution of the antilatency effect might induce long-term remission.
CONCLUSIONS: Although still an isolated case, this might represent the first long-term HIV remission without myeloablation/stem cell transplantation. Further analyses such as viral cultivation and sequential HIV antibody profile/detection are ongoing.

LBPEA01

LONG-ACTING STARCH NANOPARTICLE DRUG DELIVERY SYSTEM TO TREAT CHRONIC HIV

S. Vuoti[1], K. Narasimha[2], K. Reinikainen[2]
[1]University of Jyväskylä, Pharmaceutical Chemistry, Jyväskylä, Finland, [2]Chembrain LTD, Kauhava, Finland

BACKGROUND: Human immunodeficiency virus (HIV) patients are commonly treated with combination antiretroviral therapy (cART), which has improved life expectancy for HIV-infected patients. Oral administration has been the predominant method of drug delivery but requires strict patient adherence. Oral administration can enforce stigma for specific patient groups and thus further complicate adherence. Long-acting antiretroviral drug formulations may improve adherence to therapy and extend opportunities for therapeutic or prophylactic intervention especially to vulnerable patient populations

METHODS: We have previously patented a method for preparing starch nanoparticles (WO2015144983A1). Present study details a preclinical evaluation of novel long-acting parenteral starch nanoparticle formulations utilizing a series of both water soluble and insoluble drug combinations (EVG, TAF, FTC, RAL, TDF, EFV, 3TC, DTG) for treating HIV-1 (HIV) in a humanized mouse model. Nanoparticle formulations (n=6) were prepared by high-pressure homogenization by utilizing citric acid crosslinked starch nanoparticles. To establish HIV, mice were intravaginally challenged with HIV-1 and maintained for 12 weeks. Baseline pVL was comparable between treated (n = 24) and control (n = 8) mice groups. The treatment groups received 3 subcutaneous doses of the selected nanoparticle formulation biweekly. No safety issues, including injection site reactions, were observed. pVl was determined prior to each treatment dose and weekly after the last treatment dose.

RESULTS: Animals treated with the nanoparticle formulations demonstrated undetectable HIV in plasma and tissues. With three subcutaneous doses of cART nanoparticles, a non-detectable pVL was established between weeks 18-20. A detectable pVL was found in all groups during weeks 26-30 after treatment had been stopped. The chosen study drugs were detectable in plasma throughout the administration period. Steady release of the drugs was achieved by controlling the degree of crosslinking for the nanoparticles.

CONCLUSIONS: The present study demonstrates that the modified starch nanoparticles maintained a long-acting therapeutic concentration of the cART and suppressed cHIV in the humanized-mouse model even up to 13 weeks after final dose. The starch nanoparticles offer a bio-based, non-toxic matrix for preparing long-acting cART drug formulations without the use of any toxic chemicals. The modified starch nanoparticles provide a long-acting drug delivery system that overcomes classical drawbacks of oral administration.

LBPEA02

DRUG RESISTANCE TO NOVEL NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITOR ELSULFAVIRINE AMONG DRUG NAÏVE HIV-INFECTED CAUCASIAN AND ASIAN PATIENTS

E. Yakubova[1], A. Kirichenko[2], A. Kravchenko[2,3], R. Arsienko[1], S. Baranovsky[1], J. Remeeva[1], S. Corritori[1], N. Savchuk[1], D. Kireev[2], R. Murphy[4]
[1]Viriom, Inc., San Diego, United States, [2]Central Research Institute of Epidemiology, Moscow, Russian Federation, [3]Federal Research Centre for AIDS, Moscow, Russian Federation, [4]Northwestern University, Chicago, United States

BACKGROUND: Elsulfavirin (ESV) - the new generation NNRTI, was designed and developed with a demonstrably high genetic barrier to HIV-1 resistant mutations.

ESV has been approved for HIV-1 treatment in combination with HAART in Russia and Kazakhstan. ESV has been submitted for obtaining marketing authorization in Thailand, Indonesia, Colombia, initiated a regulatory submission in China and is in development for once weekly, once monthly or less frequent dosing.

Combinations of the major mutations V106I/A + F227C and V106I + Y188L, which were often accompanied by mutations A98G, L100I, V108I, E138K, Y181C, M230L, P236L were described for ESV resistance profile.

A recent study of drug resistance (DR) among naïve patients in Russia showed less than 1.2% frequency of the major mutations, which is the lowest for NNRTIs and comparable to INSTI therapy. This work is comparing the prevalence of DR mutations to ESV between Caucasian and Asian treatment-naïve HIV1-positive patients to estimate treatment efficiency prognosis.

METHODS: The sequences from treatment-naïve Chinese patient population (n=5661) were obtained from the Los Alamos HIV Database (www.hiv.lanl.gov).

The Stanford HIV Resistance Database was used to determine viral subtype and describe the ESV resistance profiles.

RESULTS: CRF01_AE (44.9%), CRF07_BC was detected for 27.8% viruses as the most frequent clade, subtype B - for 15.5%, CRF08_BC - for 6.4%, subtype C - for 3.2%.

The analysis of the major DR mutations to ESV showed that at least one of them was detected in 200 sequences (3.53%). V106I mutation (n=191;3.37%), Y188L (n=8;0.14%), V106A (n=2; 0.04%) were detected most often.

At least one additional ESV resistant mutation was detected in 1.24% sequences. Additional mutations were found with the following frequencies: Y181C (0.65%), V108I (0.37%), A98G (0.35%), E138K (0.07%), M230L (0.05%).

CONCLUSIONS: This work has shown that the prevalence of DR to ESV among treatment-naïve patients in Chinese subpopulation is extremely low. One or more major and accessory mutations were detected in 3.5% and 1.2% of cases, respectively.

The results suggest that ESV could be potentially used as a first line/alternative first line therapy in Europe, US, Canada and China, East and South-East Asia in combination with HAART for Caucasian an Asian treatment-naïve populations.

LBPEA03

VPU INHIBITOR BIT225 ALTERS T CELL ACTIVATION AND HOMING PLASMA MEMBRANE RECEPTOR EXPRESSION ON CD4+T CELLS (CD28 AND CCR7) AND MONOCYTE-DERIVED MACROPHAGES (CD80 AND CD86)

C. Luscombe[1], G. Ewart[1], M. Miller[1], M. Bobardt[2], P. Gallay[2]
[1]Biotron Limited, North Ryde, Australia, [2]The Scripps Institute, Immunology and Microbiology, La Jolla, United States

BACKGROUND: Chronic HIV-1 infection occurs in-part because the virus encodes accessory proteins to misdirect the host immune system so that HIV-1-infected cells can survive and propagate virus. In a recent Phase 2 clinical trial the addition of BIT225 to Atripla ® therapy resulted in a delayed decline in T cell activation. This in vitro study investigated if there was a Vpu-dependent mechanism that could result in better activation and function of T cells during ART. The costimulatory receptor of T cell activation is CD28 and its counterparts are CD80 and CD86 on macrophages, dendritic cells and B cells. Experiments were designed to identify the role of accessory proteins Vpu and Nef expression on T cell activation and homing plasma membrane (PM) receptor expression on CD4+ T cells (CD28, CCR7) and monocyte-derived macrophages (MDM)(CD80, CD86).

METHODS: CD4+ T cells and monocytes were extracted from the blood of three donors. MDM were grown in culture from monocytes isolated from PBMCs. The MDM or CD4+ T cells were infected with VSVG-pseudotyped wildtype, Vpu-, Nef- and Vpu-/Nef- HIV-1NL4-3. The expression of PM receptors CD28, CCR7, CD80 and CD86 was measured by flow cytometry. Statistical analysis of the data was performed by ANOVA.

RESULTS: HIV-1NL4-3 infection of CD4+ T cells results in downmodulation of PM expression of CD28 and CCR7. Downregulation of CD28 and CCR7 is induced by Vpu expression. CD28 expression is also impacted by Nef. BIT225 treatment increases the expression of CD28 and CCR7 in a Vpu-dependent manner. Infection of MDM with VSVG-pseudotyped HIV-1NL4-3 resulted in decreased expression of CD80 and CD86. BIT225 treatment of MDM infected with VSVG-pseudotyped HIV-1NL4-3 resulted in a partial reversal of downmodulation of CD86 which was partially Vpu-independent. BIT225 treatment partially restores CD80 expression. The effect on CD80 expression is Vpu-dependent. Double deletion of Vpu and Nef returns receptors to uninfected levels. BIT225 had no effect on Nef-HIV-1NL4-3 mutants.

CONCLUSIONS: BIT225, a Vpu inhibitor, is able to counteract the HIV-1-induced downregulation of key cellular receptors essential for T cell activation and subsequent response.

LBPEA04

NOVEL GAG AND ENVELOPE DETECTION ASSAY REVEALS VIRAL AND CELLULAR DYNAMICS DURING EARLY TREATMENT PERIODS AT THE SINGLE-CELL LEVEL

F. Otte[1], J. Spagnuolo[1], Y. Zhang[1], F. Klein[2], T. klimkait[1], Swiss HIV Cohort Study Group
[1]University of Basel, Department of Biomedicine, Basel, Switzerland, [2]University Hospital Cologne, Institute of Virology, Cologne, Germany

BACKGROUND: According to most recent studies only few PBMCs show signs of HIV-1 integration, whereof ≥95% are proven defective, which most genetic assays falsely identify as latent HIV-1 reservoir. We thus developed a new methodology called GERDA (Gag and Envelope Reactivation Detection Assay) to identify cell populations with active viral contribution and to understand viral dynamics before and after therapy initiation.

METHODS: PHA stimulated CD4 T-cells of HIV-1 infected individuals were analyzed for immune characterization and HIV-1 protein expression by FACS, utilizing tSNE and DBScan clustering algorithms to identify target cell clusters. HIV provirus and HIV intracellular transcripts were measured by qPCR. For viral outgrowth PBMCs were sorted and cultured for 3 weeks monitoring viral reactivation by Tat induced X-Gal staining.

RESULTS: Serial dilution experiments revealed detection sensitivity of our GERDA system down to ≥16 infectious input cells/10^6 cells (R^2 0.998). In PBMCs/CD4s of viremic HIV patients (n=7) most patients had surprisingly low HIV-1 activity in terms of HIV provirus (median: 163/10^6 cells (20-4'412)), HIV poly-A transcripts (median: 90/10^6 cells (56-85'003)) and HIV Gag+Env+ (DP) cells (median: 18/10^6 (2-2100)). For one patient (546) we saw highest HIV-1 activity with proviral levels of 4'412/10^6 PBMCs, transcript levels of 85'033/10^6 cells and 140 DP events in 10^6 CD3+ T-cells, suggestive for infectious particle production, with mostly central memory (TCM) phenotype. 52 days after cART initiation we saw a massive decline of productively virion producing cells by GERDA (2/10^6 cells) in line with decreased provirus (1'297/10^6) and poly-A transcripts (418/10^6). After 6 months post cART we sorted and expanded CD4 cells of Patient 546 and predominantly found DP cells in TCM, which were already detected as major reservoir by GERDA at our first sampled time point, validated by X-Gal staining.

CONCLUSIONS: This new methodology adds new value to recent reservoir questions as it reduces specimen input and comes very close to the term "real viral reservoir" since it integrates intracellular Gag and extracellular Envelope expression as a proxy for release of infectious virions from host cells validated by genetic and functional detection methods and allows reservoir characterization down to the single-cell level.

LBPEA05

CHARACTERISING THE SERUM METABOLIC PROFILE OF HIV/TB CO-INFECTION

C. Liebenberg[1], L. Luies[1], D.T. Loots[1], A. Williams[1]
[1]North-West University, Biochemistry (School of Physical and Chemical Sciences), Potchefstroom, South Africa

BACKGROUND: The metabolic mechanisms that contribute to the associated disease burden experienced during HIV/TB co-infection remain poorly understood. This limits progress towards the development of much needed, improved TB diagnostics in HIV co-infected individuals. The objectives of this study were to characterise the metabolic profile of untreated HIV/TB co-infection and the specific metabolic changes induced by untreated HIV on an untreated TB-positive population.

METHODS: Untargeted two-dimensional gas chromatography time-of-flight mass spectrometry was used to analyse the serum metabolic profiles of 9 HIV-positive and 22 HIV-negative South African adults with active pulmonary tuberculosis, as well as 29 healthy controls.

RESULTS: Using one-way analysis of variance, 18 metabolites were identified that distinguish the HIV/TB co-infected individuals from healthy controls, while five metabolites characterised HIV/TB co-infected individuals from the TB-positive population. All of the metabolites primarily corresponded to amino acid and microbial metabolic

changes. Several other metabolites which characterised TB from the healthy group, showed more pronounced changes in the HIV/TB co-infected group, relative to the healthy group, though these were not statistically significant. The large proportion of microbial metabolites supports previous findings of gut microbiome dysbiosis in HIV and TB patients. Four of the five metabolites distinguishing the HIV/TB co-infection from TB disease group, were of microbial origin, reflecting the central role of the gastrointestinal tract and the microbiome in the pathogenesis of HIV. Gut integrity loss and subsequent microbial translocation results in increased inflammation and immune/cytokine activation, culminating in a reduced appetite and malabsorption, which support the profile of exacerbated wasting.

CONCLUSIONS: Although the metabolic profile of untreated HIV/TB co-infection observed here is similar to that previously reported for HIV infection and TB disease, the changes were more pronounced and microbial metabolic alterations typically do not feature as prominently as was found here. These results suggest that HIV augments the HIV-*Mycobacterium tuberculosis* synergy, at least in part, through its detrimental effects on gut health.

LBPEA06

REANALYSIS OF NATIVE RNA SEQUENCING OF HIV-1 SUPPORTS SPLICED HIV MRNA PACKAGING INTO VIRIONS AS A NEW HYBRID SEGMENTED RETROVIRUS MODEL

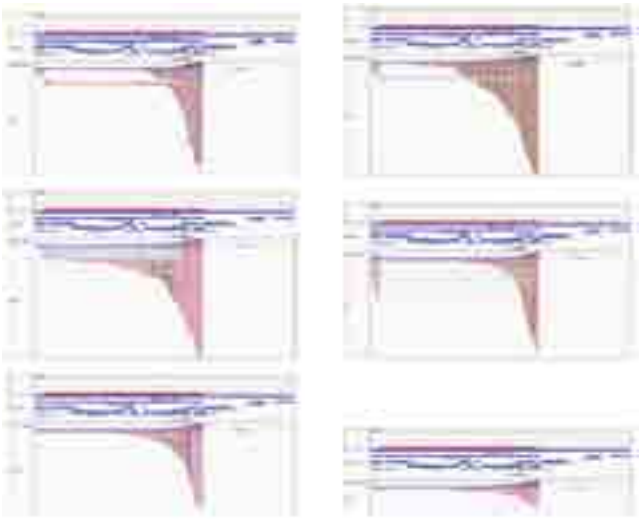
A. Gener[1,2,3], J.T. Kimata[4]
[1]Baylor College of Medicine, Margaret M. and Albert B. Alkek Department of Medicine, Nephrology, Houston, United States, [2]MD Anderson Cancer Center, Genetics, Houston, United States, [3]Universidad Central del Caribe, School of Medicine, Bayamón, United States, [4]Baylor College of Medicine, Department of Molecular Virology and Microbiology, Houston, United States

BACKGROUND: Native RNA sequencing is possible with Oxford Nanopore's Direct RNA Sequencing protocol. This kit leverages oligo-dT adapters early during library preparation to capture polyadenylated mRNAs. Recently, we (Gener and Kimata, 2019) completed the first native RNA sequencing of HIV. Despite this RNA sequencing protocol's strong 3' bias, full-length viral transcripts equivalent to HIV genomes were recovered in 3 out of 15 separate experiments. In that work we reported some coverage spikes near known HIV exons, however we did not expect to detect spliced viral transcripts.

METHODS: Data as mapped reads in FASTQ format from previous native RNA sequencing of HIV virion samples were reanalyzed with Minimap2 in Galaxy with splice-aware settings. Mapped reads were visualized in Integrative Genomics Viewer.

RESULTS: Six out of 15 samples exhibited spliced mRNAs (Figure 1). Of the samples with full-length HIV viral genomes recovered, spliced reads were observed in 89.6 2% (1 out of 50), AD17 2.58% (5/194), and NLAD8 11.34% (33/291). Spliced reads were also observed in BaL 0.59% (1/169), HIV1-SX 1.87% (2/107), and NL4-3 7.14% (2/28). False positives from 6 samples were excluded based on absence of ψ (psi) packaging element.

CONCLUSIONS: Spliced HIV mRNA can be packaged into nascent virion. This is in line with previous observations by others who have noted integration of replication-deficient HIV sequences (including sequences with large gaps). This work fundamentally changes our understanding of how HIV can introduce information into cells, augmenting the virus' ability to cause cytopathic effects after infection. A new model of HIV virion mRNA represents a shift in the understanding of the HIV genome, from a ~9 kb integrating retrovirus to a ~9 kb + splice variant hybrid segmented retrovirus. Acknowledging this shift will inform more complete observation of retroviral sequences so that we may follow the virus better as newer tools become available.



[Figure 1. HIV virions package spliced HIV mRNA. Reads are colored based on orientation relative to reference. Pink: forward. Purple: reference. HIV genome modeled from TSS to end of 3' LTR in red above reference (Accession Number AF324493.2) in blue. All HIV-mapping reads observed occurred in the forward orientation. Compare 12/13 false positives seen in BaL without the packaging element Ψ to true positive in that sample (bottom spliced read), and to robust packaging in NLAD8 (all true positive). Ψ occurs between the end of the 5' LTR and gag. Upper left: 89.6. Upper right: AD17. Middle left: NLAD8. Middle right: BaL. Bottom left: HIV1-SX. Bottom right: NL4-3.]

LBPEB07

A RANDOMIZED PROSPECTIVE STUDY EVALUATING VIROLOGIC OUTCOMES AMONG PATIENTS SWITCHING WITH DETECTABLE AND UNDETECTABLE VIRAL LOADS FROM EFAVIRENZ AND NEVIRAPINE-BASED FIRST LINE ART REGIMENS TO DTG REGIMENS IN ZAMBIA

A. Hill[1], K. McCann[2], L. Chirwa[3], A. Qavi[2], L. Mulenga[3]
[1]Liverpool University, Department of Translational Medicine,, Liverpool, United Kingdom, [2]Imperial College, School of Public Health, London, United Kingdom, [3]University of Zambia, School of Medicine, Adult Infectious Diseases Centre, Lusaka, Zambia

BACKGROUND: In sub-Saharan Africa, patients taking NNRTI based ART are being switched to fixed dose TDF/3TC/DTG, often without recent viral load results available. This switch is partly supported by results from the DAWNING trial, although this included viral load and drug resistance testing before switch. The VISEND study aims to compare virologic outcomes among ART-treated adults switched from TDF/XTC/EFV or NVP-containing regimens to TDF/3TC/DTG or TAF/3TC/DTG containing regimens with and without virologic suppression at the time of switch. There was no resistance testing before switch.

METHODS: Patients with HIV-1 RNA<1,000 copies/mL were randomized to either Tenofovir-disoproxil-fumarate, Lamivudine and Dolutegravir (TLD) or Tenofovir-alafenamide, Emtricitabine and dolute-

gravir (TAFED). Participants with HIV-1 RNA>1,000 copies/mL were randomized to TLD, TAFED, ATV/3TC+LPVr or ZDV/3TC+ATVr. The primary treatment failure endpoint was week 24 and 48 HIV-1 RNA>50 copies/mL. We report the week 24 efficacy (Observed data analysis) and safety data.

RESULTS: We randomised 1,126 PLWH into arm A (VL<1,000 copies/mL, n=419) and arm B (VL>1,000 copies/mL, n=707). In arm A, the percentage of participants with HIV RNA <50 copies/mL was 89% and 85% for TLD, and TAFED. In arm B, the percentage of participants with HIV RNA <50 copies/mL was 67%, 88%, and 65% for TLD, TAFED and AZT+3TC+LPVr/ATVr. Clinical adverse events and laboratory abnormalities were similar between treatment arms. Weight change was +0.4 and +1.7 for TLD and TAFED in arm A (p<0.05). There were statistically significant differences between TLD and TAFED compared to ZDV/3TC+LPV/r or ATV/r in arm B (p<0.05).

	Arm A: TLD	ARM A: TAFED	ARM B: TLD	ARM B: TAFED	ARM B: AZT+3TC+LPVr or ATVr
Baseline (n)					
Women (%)	67%	58%	59%	61%	60%
age	43	42	37	39	37
HIV RNA (copies/mL), mean(SD)	83 (179)	106(449)	104,375(162)	113,939 (332)	221,578 (266)
CD4 (cells/m3), mean (SD)	498 (275)	482 (111)	242 (667)	242 (332)	237 (222)
Weight (kg), mean(SD)	66 (15)	65 (14)	60 (13)	59 (13)	61 (13)
Week 24					
HIV-1 RNA (n<50 copies/mL/total), %	145/163 (89%)	111/130 (85%)	41/61 (67%)	51/57 (88%)	31/48 (65%)
Weight change (kg), mean(SD)	+0.4 (4.7)	+1.7 (3.8)	+2.2 (5.4)	+2.3 (4.1)	+0.6 (5.0)

[Table]

CONCLUSIONS: In the VISEND study, TAFED demonstrated similar efficacy to TLD, with low rates of virologic failure at week 24 in participants with <1,000 copies/mL at time the time of switch. In comparison, participants with >1,000 copies/mL at the time of switch showed higher rates of suppression on TAFED compared to other treatment arms.

LBPEB08

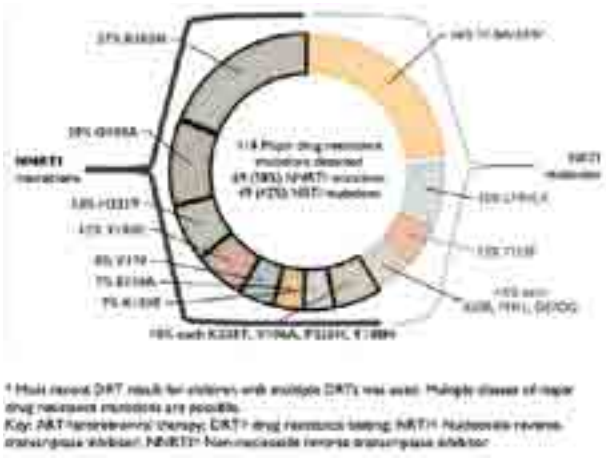
HALF OF CHILDREN LIVING WITH HIV WITH VIROLOGIC FAILURE HAVE DRUG RESISTANCE REQUIRING ANTIRETROVIRAL REGIMEN CHANGE: EARLY INSIGHTS FROM A RANDOMIZED TRIAL IN WESTERN KENYA

L. Abuogi[1], B. Ahmed[2], P. Oyaro[3], B. Odeny[4], I. Mukui[5], I. Njuguna[4], E. Kariuki[6], E. Kinywa[7], B. Oyaro[8], J. Wagude[7], R. Patel[4]
[1]University of Colorado Denver, Pediatrics, Aurora, United States, [2]University of Colorado Denver, Aurora, United States, [3]Health Innovations Kenya, Kisumu, Kenya, [4]University of Washington, Seattle, United States, [5]Ministry of Health, Kenya, Nairobi, Kenya, [6]University of Washington Kenya, Kisumu, Kenya, [7]Department of Health, Kisumu, Kisumu, Kenya, [8]Kenya Medical Research Institute, HIV Research Laboratory, Kisumu, Kenya

BACKGROUND: Children living with HIV (CLHIV) on antiretroviral therapy (ART) achieve low rates of virologic suppression. Most guidelines in resource limited settings recommend intensified adherence counseling and repeat viral load testing for CLHIV with virologic failure (VF) on first line regimens without drug resistance testing (DRT). In an on-going randomized trial, we conducted targeted DRT testing for children with VF in the intervention arm.

METHODS: 704 CLHIV ages 1-14 years were enrolled in the Opt4Kids study from five government facilities in Kisumu County, Kenya March to December 2019. Children were individually randomized 1:1 to control (standard-of-care) or intervention (point-of-care viral load testing every three months with DRT for those with VF [> 1000 copies/ml]) arms. DRT was performed for CLHIV in the intervention arm using consensus sequencing and results discussed by a clinical management committee comprised of research staff, pediatric and HIV experts, and facility health care workers. We use descriptive analyses to report the DR patterns and treatment recommendations.

RESULTS:



[Figure 1. Percentage of children with each mutation among 60 children on ART undergoing DRT for virologic failure in Kenya]*

Among 365 CLHIV in the intervention arm, median time on ART 70.7 months, 60 (16%) had at least one DRT requested per protocol and 51 (85%) had DR mutations (DRM). Forty-eight (80%) of CLHIV with DRT had non-nucleoside reverse transcriptase (NNRTI) resistance, 36 (60%) nucleoside reverse transcriptase inhibitor (NRTI) resistance, 33 (55%) both NNRTI and NRTI, and 9 (15%) had no resistance. In 30 CLHIV (50%) with DRT results, an ART regimen change was recommended, 90% of whom were on an NNRTI-based regimen. Most common DRM are described in Figure 1.

CONCLUSIONS: Early review of CLHIV undergoing targeted DRT shows improved adherence alone is unlikely to result in viral suppression for a substantial proportion of CLHIV with VF. Early DRT for CLHIV with VF may be a critical tool in determining appropriate ART, in order to ensure optimal health outcomes for CLHIV.

LBPEB09

COMPARATIVE OUTCOMES IN HOSPITAL ADMISSIONS WITH COVID-19 IN PEOPLE LIVING WITH HIV AND PEOPLE LIVING WITHOUT HIV: A RETROSPECTIVE STUDY

M.J. Lee[1], C.J. Smith[2], L.B. Snell[3], J. Lwanga[1], R. Simons[1], N. Fitzgerald[1], V. Sivaraj[1], S.T. Douthwaite[4], R. Kulasegaram[1], J. Fox[1], A.V. Nori[5]
[1]Guys' and St Thomas' NHS Foundation Trust, Harrison Wing, Department of HIV, London, United Kingdom, [2]University College London, Institute for Global Health, London, United Kingdom, [3]King's College London, Centre for Clinical Infection & Diagnostics Research, London, United Kingdom, [4]Guys' and St Thomas' NHS Foundation Trust, Department of Virology, London, United Kingdom, [5]Guys' and St Thomas' NHS Foundation Trust, Integrated Sexual Health and HIV, London, United Kingdom

BACKGROUND: Information on outcomes of COVID-19 infections in people living with HIV (PLWH) is scarce. We compared outcomes of PLWH hospitalised with COVID-19 with matched HIV-negative patients from the same hospital.

METHODS: In this retrospective study, PLWH and matched HIV-negative patients with confirmed COVID-19 admitted between 01/03/2020 and 30/04/2020 were included. Matching was blinded to outcomes, up to a 3:1 ratio, by test date (±7 days), age (±5 years), gender, and deprivation index decile (±1). The primary endpoint was defined as the time from COVID-19 diagnosis to

1. ≥2 points improvement from baseline on an ordinal scale [1 not hospitalised - normal activities, 7 death or palliation];
2. Discharge from hospital.

Cox-proportional hazards regression was performed for confounding variables.

RESULTS: Patient characteristics are presented (Table 1). During 28-days' follow-up, there were 0 (0%) and 5 (10%) deaths among PLWH and HIV-negative patients respectively; 14 (82%) and 37 (74%) were discharged; 13 (76%) and 34 (68%) experienced ≥2 points improvement. Median (IQR) time to improvement was 5 days (4-13) in PLWH compared to 9.5 days (3-15) in HIV-negative (p=0.635).

Adjusting for ethnicity, BMI, smoking status, hypertension, diabetes with complications, baseline hypoxia, frailty score, end stage renal failure, cardiac disease and chronic lung disease, PLWH were more likely to reach the primary endpoint (HR=2.67; 95% CI 1.21–5.91, p=0.015; Figure 1.)

	PLWH (n = 17)		HIV-negative individuals (n=50)		p-value
	N	%	N	%	
Mean [SD] Age *	51.3	(11.5)	49.8	(12.2)	
Mean [SD] Index of Multiple Deprivation Decile * (1 least affluent, 10 most affluent)	3.47	(3.55)	3.64	(3.66)	
Male Gender *	10	58.8%	30	60.0%	
Non-white Ethnicity	10	58.8%	27	61.4%	0.856
Median [range] time since HIV diagnosis (years)	13.5	(0.25 - 34)			
Median [Range] CD4 cells (cells/uL)	452	(22 - 1090)			
On antiretroviral therapy (ART)	14	82%			
Suppressed HIV Viral load (<200copies/ml)	15	88%			
Antiretroviral therapy					
- Protease inhibitors	6	(35%)			
- Integrase inhibitors	9	(53%)			
- NNRTIs	3	(18%)			
- Tenofovir disoproxil fumarate (TDF)	3	(18%)			
- Tenofovir alafenamide (TAF)	5	(29%)			
Current smoker	3	20.0%	3	6.7%	0.270
Hypertension	8	47.1%	21	42.0%	0.420

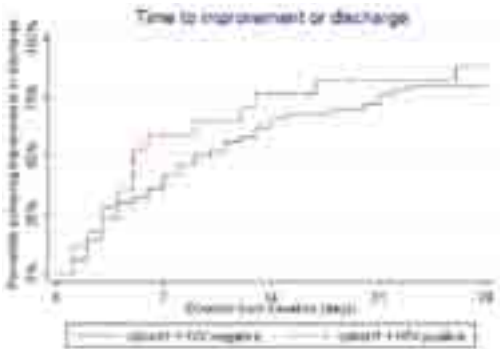
Chronic pulmonary disease	2	11.8%	5	10.0%	1.000
Mean Baseline Body Mass Index	27.32	6.48	32.14	9.56	0.060
Mean [SD] Baseline Clinical Frailty Score	3.00	1.37	2.36	1.39	0.261
Baseline COVID-19 disease characteristics					
Median [range] duration from symptom onset (days)	7	0 - 21	8	1 - 21	0.641
Baseline ordinal score 24 (Hospitalised requiring oxygen)	12	70.6%	34	68.0%	0.843
Admission reason related to COVID-19	14	82.4%	43	86.0%	0.682

[Table 1. Patient demographics, characteristics, and co-morbidities
**Matching variables - therefore characteristics comparable between groups]*



[Figure 1. Kaplan-Meier plot of time to clinical imporvement or discharge in PLWH and HIV-negative cohorts]

CONCLUSIONS: PLWH had fewer deaths and did not experience worse outcomes than HIV-negative patients, suggesting HIV is not a negative prognostic indicator in COVID-19. SARS-CoV-2 infections occur in patients receiving tenofovir or protease inhibitors.

LBPEB10

CHANGES IN NICOTINE METABOLITE RATIO IN HIV+ SMOKERS AFTER VIRAL SUPPRESSION ON ANTIRETROVIRAL THERAPY

C. Bien-Gund[1], W. Bilker[1], R. Schnoll[1], R. Tyndale[2], J. Ho[1], R. Bremner[1], R. Ashare[1], R. Gross[1]
[1]University of Pennsylvania, Philadelphia, United States, [2]University of Toronto, Toronto, Canada

BACKGROUND: People with HIV (PWH) are nearly three times more likely to smoke than the general population. Faster nicotine metabolism in PWH than HIV-uninfected individuals may contribute to this disparity. Higher levels of the nicotine metabolite ratio (NMR; 3-hydroxycotinine:cotinine), a validated biomarker of nicotine metabolism via CYP2A6, are associated with increased tobacco use and nicotine dependency. We investigated whether antiretroviral therapy (ART) increases NMR among HIV+ smokers and hypothesized that efavirenz, a substrate of CYP2A6, would result in higher NMR.

METHODS: We conducted a retrospective study in adult smokers with HIV in the University of Pennsylvania Center for AIDS Research cohort. We compared the NMR from paired plasma samples before viral suppression (>10,000 copies/ml) and after suppression on ART (<200 copies/ml). We used mixed effects linear regression to determine the change in nicotine metabolite ratio after viral suppression. Potential confounders were retained in the adjusted model if the association between viral suppression and NMR changed by more than 15%. We targeted a sample size of 73 for 80% power to detect a 0.1 change in NMR after viral suppression.

RESULTS: 120 individuals had detectable cotinine levels, of which 89 had cotinine levels >10 ng/ml, consistent with regular smoking and were included in the primary analysis. Individuals were 63% male, had a median age of 40 years (IQR 35-46), median CD4 of 275 cell/mm3 (IQR 130-424), with 27% on efavirenz. The mean NMR prior to ART was 0.42 (SD 0.30). In those on efavirenz, mean NMR increased after viral suppression by 0.57 (P<0.001), while among those on all other ART, mean NMR increased by 0.10 (P=0.03) after viral suppression. The results were unchanged after controlling for confounders and when including individuals with cotinine levels <10 ng/ml.

CONCLUSIONS: We observed an increase in NMR after viral suppression among HIV+ smokers, which was even more pronounced among those on efavirenz-based regimens. These findings may help

explain higher rates of tobacco use and lower quit rates among PWH in care. Future research can test if higher NMR rates portend lower quit rates among PWH and whether choice of ART may affect cessation success.

LBPEB11

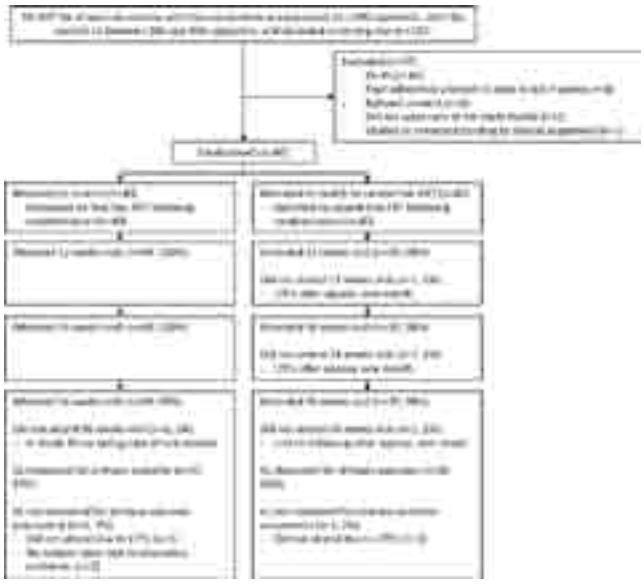
SWITCH TO SECOND-LINE VERSUS CONTINUED FIRST-LINE ANTIRETROVIRAL THERAPY FOR PATIENTS WITH LOW-LEVEL HIV-1 VIRAEMIA: AN OPEN-LABEL RANDOMISED CONTROLLED TRIAL

A. Amstutz[1,2,3], B.L. Nsakala[4], F. Vanobberghen[1,2], J. Muhairwe[4], T.R. Glass[1,2], T. Namane[5], T. Mpholo[6], M. Battegay[2,3], T. Klimkait[7], N. Labhardt[1,2,3]
[1]Swiss Tropical and Public Health Institute, Basel, Switzerland, [2]University of Basel, Basel, Switzerland, [3]University Hospital Basel, Department of Infectious Diseases and Hospital Epidemiology, Basel, Switzerland, [4]SolidarMed, Butha Buthe, Lesotho, [5]Motebang Government Hospital, Hlotse, Lesotho, [6]Senkatana HIV Clinic, Maseru, Lesotho, [7]University of Basel, Molecular Virology, Department of Biomedicine, Basel, Switzerland

BACKGROUND: Current World Health Organisation (WHO) antiretroviral therapy (ART) guidelines define virologic failure as two consecutive viral loads (VL) ≥1000 copies/mL despite good adherence, triggering empiric switch to next-line ART. This trial assessed if patients with sustained low-level HIV-1 viraemia on first-line ART benefit from switch to second-line.

METHODS: This multicentre, parallel-group, open-label, superiority, randomised controlled trial enrolled patients on first-line ART containing non-nucleosidic reverse transcriptase inhibitors with two consecutive VLs ≥100 copies/mL, with the second VL between 100-999 copies/mL, from eight clinics in Lesotho. Consenting participants were randomly assigned (1:1), stratified by facility, demographic group, and baseline VL, to either switch to second-line ART (switch group) or continued first-line ART (control group; WHO guidelines). The primary endpoint was viral suppression (<50 copies/mL) at 36 weeks. Analyses were by intention to treat, using logistic regression models adjusted for demographic group and baseline VL. The trial is registered at ClinicalTrials.gov, NCT03088241.

RESULTS: Between Aug 1, 2017, and Aug 7, 2019, 137 individuals were screened, of whom 80 were eligible and randomly assigned to switch (n=40) or control group (n=40).



[Figure]

The majority of participants was female (54 [68%]) with a median age of 42 years (interquartile range 35-51) and taking tenofovir disoproxil fumarate / lamivudine / efavirenz (49 [61%]). At 36 weeks, 22/40 (55%) participants in the switch versus 10/40 (25%) in the control group achieved viral suppression (adjusted difference 29%, 95% CI 8-50%, p=0·009).

The switch group had significantly higher probability of viral suppression across different VL thresholds (<20, <100, <200, <400 copies/mL) but not for <1000 copies/mL. No serious adverse events were observed.

CONCLUSIONS: Switching to second-line ART among patients with low-level HIV-1 viraemia resulted in higher proportion of viral suppression. These results endorse lowering the threshold for virologic failure in future WHO guidelines.

LBPEB12

BLACK ETHNICITY IS A RISK FACTOR FOR HOSPITALIZATION WITH COVID-19 IN PEOPLE WITH HIV

C. Norcross[1], K. Childs[1], Z. Ottaway[1], T. Juniper[1], E. Hamlyn[1], K. Quinn[1], C. Taylor[1], F. Post[1]
[1]King's College Hospital NHS Foundation Trust, London, United Kingdom

BACKGROUND: People with HIV (PWH) may be variably immunosuppressed and thereby at risk of severe coronavirus disease 2019 (COVID-19). There are few reported data on the risk factors and clinical outcomes of COVID-19 in PWH.

METHODS: We identified PWH under the care of King's College Hospital in South London, an area early and severely affected by the pandemic, who were hospitalized with COVID-19 in March/April 2020. We compared their clinical characteristics to our overall HIV outpatient cohort using Kruskal-Wallis (continuous variables) and Fisher's exact (categorical variables) tests.

RESULTS: Twenty-three PWH (18 confirmed SARS CoV-2 RNA positive) required hospitalisation for COVID-19. The median age was 52 (IQR 48, 57) years; 65% were male; 91% of black ethnicity; 91% had HIV RNA <200 cps/mL; 35% had CD4 counts <350 cells/μL. Comorbidities were common (obesity [BMI >30 kg/m^2] 43%, hypertension 35%, diabetes 22%, chronic kidney disease 30%, frailty [clinical frailty score ≥5] 22%). Eight patients (35%) required ITU admission for mechanical ventilation, inotropic support and/or renal replacement therapy. Seven patients (30%) died. Compared to the overall HIV outpatient population, those hospitalized for COVID-19 were more likely to be of black ethnicity (OR 7.6 [95%CI 1.8, 32.3]) and had somewhat lower CD4 cell counts. No protective effect of the major classes of antiretroviral therapy or tenofovir was observed (Table 1).

Parameter		HIV/COVID-19 (N=23)	King's College Hospital HIV full outpatient cohort (N=2555)	Odds ratio (95%CI)	P value
Age [years]		52 (48, 57)	40 (31, 50)	-	0.14
Male gender		15 (65)	1644 (61)	1.20 (0.51, 2.85)	0.69
Black ethnicity (vs. other)		21 (91)	1670 (65)	7.56 (1.77, 32.27)	0.003
Pre-admission CD4 count [cells/μL]		432 (253, 683)	573 (353, 764)	-	0.05
VL <50 [copies/mL]		19 (83)	2252 (88)	0.64 (0.29, 2.46)	0.77
Antiretroviral therapy *	Protease inhibitor	14 (61)	912/2322 (39)	2.45 (1.04, 5.08)	0.03
	Integrase strand transfer inhibitor	8 (35)	675/2322 (29)	0.80 (0.34, 2.19)	1.00
	Non-nucleoside reverse-transcriptase inhibitor	5 (22)	752/2322 (34)	0.55 (0.20, 1.48)	0.27
	Nucleoside reverse-transcriptase inhibitor	23 (100)	2163/2322 (94)	3.00 (0.18, 49.70)	0.40
	Tenofovir †	15 (65)	1344/2322 (58)	1.36 (0.57, 3.23)	0.53

Continuous variables (age and CD4 count) are presented as median (IQR) and compared by Kruskal-Wallis test, categorical variables are presented as N (%) and compared using Fisher's exact test.
* Antiretroviral prescribing data were available for patients attending the main hospital clinic only and not a satellite clinic
† Tenofovir includes both tenofovir disoproxil fumarate (TDF) and tenofovir alafenamide (TAF)

[Table 1. Clinical characteristics of PWH requiring admission for COVID-19 vs whole outpatient cohort]

CONCLUSIONS: Black ethnicity was a risk factor for COVID-19 hospitalization. Immunodeficiency may be an additional risk factor for developing severe COVID-19. We found no protective effect of HIV viral suppression or specific classes of ART. These results need to be confirmed in larger cohorts.

LBPEB13

RACIAL DISPARITIES AND HIGH RATES OF EXPOSURE TO CONGREGATE SETTINGS AMONG A COHORT OF PEOPLE LIVING WITH HIV AND COVID-19

E.A. Meyerowitz[1], A.Y. Kim[1], K.L. Ard[1], N. Basgoz[1], J.T. Chu[1], R.M. Hurtado[1], C.K. Lee[1], W. He[2], T. Minukas[1], S. Nelson[1], B.O. Ojikutu[1], G. Robbins[1], S. Sanchez[1], V.A. Triant[1], K.C. Zachary[1], R.T. Gandhi[1]
[1]Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States, [2]Massachusetts General Hospital, Division of General Internal Medicine, Boston, United States

BACKGROUND: Little is known about the risk factors, presentation, diagnosis and course of coronavirus disease 2019 (COVID-19) in people living with HIV (PLWH).

METHODS: During a major outbreak of COVID-19 in Massachusetts from March 3 to April 26, 2020 we systemically identified all PLWH who had confirmed COVID-19 at a large hospital. COVID-19 was flagged in the electronic medical record for each patient. HIV status was identified using diagnosis code, HIV Ab/Ag test or HIV RNA ordered, and then confirmed by manual review.

RESULTS: We identified 36 confirmed cases of COVID-19 in PLWH (21 men and 15 women). Sixteen (44%) were non-Hispanic Black and 12 (33%) were Hispanic/Latinx, compared with the population in our HIV clinic of around 30% non-Hispanic Black and 10% Hispanic/Latinx. The average overall age of the cohort was 53.4 years, with a higher average age of 55.9 years for those who required hospital admission compared with 50 years for those managed as outpatients. Nearly 60% required hospitalization including 8 patients with severe disease (requiring supplemental oxygen) and 7 patients requiring intensive care. Two (5.6%) patients died. Among those diagnosed with COVID-19, nearly 85% had a comorbidity associated with severe disease including obesity (33%), hypertension (31%), diabetes (22%), hyperlipidemia (22%), and chronic kidney disease (22%). Nearly half of the cohort (16/36) lived or worked in a congregate setting including a skilled nursing facility, group home, or assisted living.

CONCLUSIONS: In this large cohort of people with HIV, non-HIV comorbidities were present in the vast majority, suggesting these risk factors play the dominant role in COVID-19 outcomes. The high rate of COVID-19 among racial and ethnic minorities with HIV highlight the importance of structural forces that drive the "twin" pandemics of HIV and COVID-19; these social factors must be studied urgently so they can be understood and mitigated. Finally, the high rate of exposure to congregate settings among people with HIV and COVID-19 makes clear that more must be done to protect vulnerable people in such settings.

LBPEB14

COVID-19 IN PEOPLE LIVING WITH HIV (PLWH): A CASE SERIES OF MEXICO

E. Perez Barragan[1], B. Crabtree-Ramirez[2], Y. Serrano Pinto[2], C. Espejo Ortiz[2], M. Manríquez Reyes[3], V. Figueroa Pólito[4], B. Pérez Orozco[5], M. Gómez Palacio[6], V. Rodríguez Pérez[7], A. Albarran Sanchez[8]

BACKGROUND: As of May 2020, more than 5 million people have been reported worldwide with COVID19 caused by SARS-CoV-2. In Mexico more than 65,000 cases with more than 6,000 deaths have been confirmed. The main risk factors for severe COVID19 described are diabetes, hypertension, cardiovascular disease, chronic kidney disease and chronic lung disease. HIV infection has not been found to be an independent factor for severe COVID19, however, only small case series of HIV and COVID-19 have been reported. We describe clinical characteristics of PLWH and COVID-19 in 8 sites in Mexico.

METHODS: A retrospective study of patients with previously documented HIV infection and confirmed SARS-CoV-2 infection from 8 centers in Mexico were included from April 12 to May 20, 2020. Demographic data, comorbidities, last CD4 count (cells/mm3) and HIV-RNA viral load (VL, copies/mL), ARTc, clinical presentation of COVID-19 and clinical outcome was collected.

RESULTS: 24 PLWV and COVID-19 were included. Twenty-one were men (88%) with a mean age of 38.5 years (IQR 30-46years),15 (62.5%) patients required hospitalized care.

All patients were receiving ARTc: 20 based on INSTI (17 on BIC/TAF/FTC), 2 PIs, and 1 NNRTI. The median CD4 was 596 (IQR 261-931). 21/24 had HIV-RNA undetectable VL. Most common comorbidity was obesity followed by hypertension and chronic kidney disease (Table 1). The mean days since onset of COVID19 symptoms was 5.5 days. 16 presented with pneumonia and 4 had severe disease requiring mechanical ventilation, of whom, 2 were successfully extubated and 4 died (Table 2). At the time of this report, 15 patients had been discharged.

Gender	
Males	**87.5%**
Females	**12.5%**
Age, median (IQR)	38.50 (30- 46)
CD4 cells, median (IQR)	596.5 (261-931)
HIV status	
Undetectable	87.5%
Non undetectable	12.5%
Antiretroviral Treatment	
INSTI	83.3%
NNTR	8.3%
PI	8.3%
Comorbidities	
Obesity	29%
Hypertension	12.5%
CKD	12.5%
Tobacco use	12.5%
Diabetes	8.3%
Asthma	8.3%
Cancer	8.3 %
Depression	8.3%

[Table 1]

	Patient 1	Patient 2	Patient 3	Patient 4
Age (years)	20	45	68	56
Gender	Male	Male	Male	Male
ART-regimen	BIC/TAF/FTC	BIC/TAF/FTC	BIC/TAF/FTC	BIC/TAF/FC
CD4 cell count (cells/μL)	58	669	357	288
HIV-RNA copies	Unknown	<50	<50	770
Comorbidities	Plasmablastic non-hodgkin lymphoma	Obesity	Hypertension and CKD	None
Invasive mechanical ventilation	Yes	No	No	Yes
Comments	VIH stage C3, without virological control. Chemotherapy for the last 2 months.	Developed ARDS and did not accept intubation with mechanical ventilation.	On admission with severe pneumonia.	Presented with ARDS and died 48 hours after admission.

[Table 2]

CONCLUSIONS: In this case series of PLWH and COVID19 mortality similar to other reports of coinfection and non-HIV population. Our data may support the fact that HIV does not contribute to a greater increased risk of severe/fatal COVID19. Larger comparative studies with the non-HIV population are needed.

LBPEB15

CLINICAL CHARACTERISTICS, RISK FACTORS, AND INCIDENCE OF SYMPTOMATIC COVID-19 IN A LARGE COHORT OF PLWH: A SINGLE-CENTER, PROSPECTIVE OBSERVATIONAL STUDY (COVIH19-BCN STUDY)

A. Inciarte[1], A. González-Cordón[1], J. Rojas[1], B. Torres[1], E. De Lazzari[1], l. de la Mora[1], M. Martinez-Rebollar[1], M. Laguno[1], P. Callau[1], A. Gonzalez-Navarro[2], L. Leal[1], F. Garcia[1], J. Mallolas[1], M.d.M. Mosquera[3], M.A. Marcos[3], J. Ambrosioni[1], J.-M. Miro[1], E. Martinez[1], J.-l. Blanco[1], COVID-19 in HIV Investigators
[1]Hospital Clinic Barcelona, Infectious Diseases, Barcelona, Spain, [2]Hospital Clinic Barcelona, Inmunology, Barcelona, Spain, [3]Hospital Clinic Barcelona, Microbiology, Barcelona, Spain

BACKGROUND: It is unclear whether characteristics, risk factors, and incidence of COVID-19 in people living with HIV (PLWH) are different from those in the general population.

METHODS: Prospective observational single-centre cohort study of adult PLWH reporting symptoms of COVID-19. We assessed clinical characteristics, risk factors for COVID-19 diagnosis and severity, and standardized incidence rate ratio for COVID-19 cases in PLWH cohort and Barcelona inhabitants.

RESULTS: Fifty-three (0.9%) PLWH were diagnosed with COVID-19 during the study period. Median age was 44 years, 15% were women, median CD4 T cells were 618/mm3 and CD4/CD8 was 0.90. All but two individuals were virologically suppressed. Cough (87%) and fever (82%) were the most common symptoms. Twenty-six (49%) were admitted, 6 (14%) had severe disease, 4 (8%) required intensive care, and 2 (4%) died. Several laboratory markers (lower O2 saturation, higher leukocytes, lower platelets, higher C reactive protein, higher procalcitonin, higher creatinine, higher LDH, and higher ferritin) were associated with COVID-19 severity. No HIV or antiretroviral factors were associated with COVID-19 diagnosis or severity. The standardized incidence rate ratio of confirmed COVID-19 was 38%, (95% CI 27%-52%, P<0.0001), and that of confirmed/probable was 62% and that of confirmed/probable COVID-19, 33% (95% CI 21%-50%, P<0.0001), a 62% and 67% lower in PLWH than in the general population, respectively.

CONCLUSIONS: COVID-19 in PLWH showed similar clinical characteristics and outcome as those reported in the general population, HIV or antiretroviral factors did not play a major role on the risk or severity, and incidence in PLWH was lower than in the general population. These findings should be confirmed in larger multicenter cohort studies.

LBPEB16

THE IMPACT OF THE COVID-19 PANDEMIC ON PATIENT RE-ENGAGEMENT WITHIN FIVE LONDON HIV CENTRES

S. Dakshina[1], C. Orkin[2,1], B. Dragovic[3], A. Umaipalan[4], V. Apea[1,2]
[1]Barts Health NHS Trust, London, United Kingdom, [2]Queen Mary University of London, London, United Kingdom, [3]St George's University Hospital NHS Trust, Courtyard Clinic, London, United Kingdom, [4]Barking, Havering and Redbridge NHS Trust, Outpatients East, London, United Kingdom

BACKGROUND: As the COVID-19 pandemic evolved, several HIV services across London observed that people living with HIV (PLWH) who disengaged for >12 months (defined as lost to follow up (LTFU)) or those noted to be poor adherers to antiretroviral therapy (ART) and/or poor clinic attenders were re-engaging with HIV care. We describe and characterise these re-engagers within five London HIV centres.

METHODS: Five HIV centres across three London NHS trusts identified those either LTFU or had not attended >two clinic appointments, and/or had documented poor ART adherence in the past 12 months, who re-engaged since COVID-19. Electronic patient records were reviewed to collect data on demographics, mode and date of contact, HIV duration, duration off ARVs, CD4/HIV viral load, ART re-initiation, 2019 index of multiple deprivation rank, social/lifestyle factors, psychological issues and COVID-19 status. All analyses were performed using STATA 14.

RESULTS: Sixty patients re-engaged; 45% female; mean age 40 years, 50% black African; 48% (29/60) LTFU and 52% (31/60) poor adherers/attenders. Median CD4 208 cells/mm3 (IQR 98-376); median HIV viral load 26,800 copies/ml (IQR 796-112,000)

70% (42/60) resided in the most deprived local authorities in London; 42% from the most deprived local authorities in England.

67% independently contacted the clinic to restart ART/re-engage. 5(8%) re-engaged following a recent inpatient admission; 1/5 admitted with COVID-19. 3 (5%) COVID-19-positive.

41/60(69%) off ARVs in past 12-months; 80%(48/60) re-started ART on re-engagement. 71% of poor adherers/attenders and 55% of LTFU maintained contact since re-engaging.

28/60(47%) re-engaged early in the lockdown and further increase seen at easing of the lockdown.

CONCLUSIONS: COVID-19 has prompted significant re-engagement of PLWH into HIV care. Key factors associated with re-engagement were Black ethnicity, high deprivation, mental health concerns and smoking.

This data suggests that PLWH may perceive themselves at increased risk of COVID-19 despite relatively low incidence. Further work is needed to understand the psychological impact of COVID-19 on PLWH and their health-seeking behaviour.

The pandemic has created an opportunity to re-engage patients but, has also created broader socio-economic challenges. Further work is needed to reinforce health messaging and shape service delivery to support PLWH to remain engaged in care.

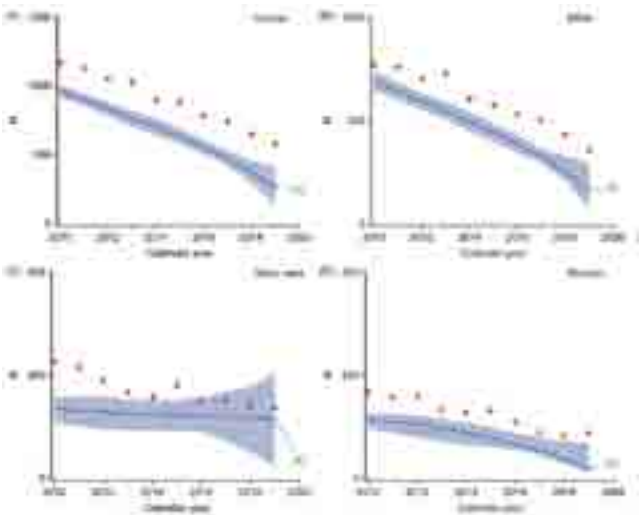
TRACK C

LBPEC17

A MAJOR REDUCTION IN ESTIMATED NEWLY-ACQUIRED HIV INFECTIONS SHOWS THE NETHERLANDS IS ON TRACK TO ACHIEVE THE UNITED NATIONS 2020 INCIDENCE TARGET

A. van Sighem[1], E. Op de Coul[2], B. van Benthem[2], S. David[2], P. Reiss[1,3,4]
[1]Stichting HIV Monitoring, Amsterdam, Netherlands, [2]National Institute for Public Health and the Environment, Bilthoven, Netherlands, [3]Amsterdam University Medical Centers, University of Amsterdam, Department of Global Health and Division of Infectious Diseases, Amsterdam, Netherlands, [4]Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands

BACKGROUND: One of the United Nations (UN) 2020 targets is a 75% reduction in HIV incidence compared with 2010. In the Netherlands, numbers of newly-diagnosed infections have been steadily decreasing since 2010 and we investigated whether this also means the country is on track of achieving this UN 2020 target.
METHODS: Data on people diagnosed with HIV-1 during 2000-2019 were retrieved from the ATHENA national HIV database. We excluded people originating outside of the Netherlands with documented HIV diagnosis before arrival. Diagnoses during 2015-2019 were adjusted for reporting delay by estimating the delay distribution using the European Centre for Disease Prevention and Control (ECDC) HIV Estimates Accuracy Tool. Annual numbers of newly-acquired infections were estimated with the ECDC HIV Modelling Tool, a CD4 count-based back-calculation method, for the entire population and separately for men who have sex with men (MSM), other men, and women.
RESULTS: 20,838 people were newly diagnosed during 2000-2019. We excluded 1,170 migrants already diagnosed before arrival, but included 5,960 migrants for whom data on pre-arrival diagnosis were not yet available. Of the 19,668 individuals included in the analysis, 11,883 (60%) were MSM, 4,136 (21%) other men, and 3,649 (19%) women. Numbers of newly-diagnosed infections decreased from 1,167 in 2010 to 579 in 2019 (Figure). The majority of diagnoses and estimated newly-acquired infections were in MSM. Compared with 2010, estimated HIV incidence in 2019 had declined by 72% (95% confidence interval 61–86) in the total population, 76% (58–89) in MSM, 14% (-75–85) in other men, and 83% (31–91) in women.



[Figure. Annual number of newly-diagnosed (dots) and estimated newly-acquired HIV infections (solid line) in the Netherlands, (A) overall, (B) MSM, (C) other men, (D) women. Diagnoses during 2015-2019 were adjusted for reporting delay. The cross indicates the UN 2020 target.]

CONCLUSIONS: Inherent to the nature of back-calculation methods, estimates are less precise in recent years and we could not fully account for infections prior to immigration. Nonetheless, estimated HIV incidence has markedly declined in the Netherlands, and may have reached the UN 2020 target, including in MSM.

LBPEC18

CASH TRANSFER TO ADOLESCENT GIRLS AND YOUNG WOMEN TO REDUCE SEXUAL RISK BEHAVIOUR: A CLUSTER RANDOMISED CONTROLLED TRIAL, TANZANIA

J. Materu[1], G. Mbita[2], E. Kuringe[1], C. Casalini[2], D. Nyato[1], M. Drake[2], S. Nnko[1], J. Reed[3], K. Curran[3], D. Mjungu[2], E. Majani[2], A. Shao[1], U. Kategile[4], A. Christensen[2], J. Changalucha[1], A. Komba[2], M. Wambura[1]
[1]National Institute for Medical Research, Mwanza, Tanzania, United Republic of, [2]Jhpiego, Dar es Salaam, Tanzania, United Republic of, [3]Jhpiego, Baltimore, United States, [4]USAID, Dar es Salaam, Tanzania, United Republic of

BACKGROUND: In sub-Saharan Africa, adolescent girls and young women (AGYW) aged 15-24 are 1.5-3 times more likely to be HIV-infected compared with their male counterparts. Cash transfers (CT) have been used to incentivize reducing HIV risk behaviours. A cluster randomised controlled trial to evaluate the effect of CT on risky sexual behaviour was conducted in Shinyanga region, Tanzania, where the PEPFAR/USAID funded Sauti Project provided combination HIV prevention (CHP) services to AGYW under the DREAMS Initiative. The trial compared CT plus CHP to CHP alone.
METHODS: From Dec 2017 to July 2019, the trial enrolled HSV-2 negative, out-of-school AGYW aged 15-23 in rural and urban areas of Shinyanga region. Village-based Clusters were ranked by size and matched by urbanization and risk categories (urban, rural low HIV risk and rural high HIV risk (mining areas). Thirty clusters were randomized to receive CT plus CHP interventions (n=15) or CHP only (n=15). Data were collected through Audio Computer-Assisted Self-Interviews and blood specimens collected for HSV-2 determination. Analysis was based on cluster-level summary measures.
RESULTS: 3,026 AGYW completed baseline survey procedures (1,482 in intervention and 1544 in control sites.) 1855 (930 intervention, 925 control) were eligible for longitudinal analysis. HSV-2 incidence was not significantly different between the intervention and control villages in the adjusted analysis (aRR 0.97, 95% CI 0·73–1·29). HSV-2 incidence was significantly lower in the intervention compared to the control group in rural low HIV risk sites (aRR 0.47, 95% CI 0.30-0.74) and higher in the intervention group in rural high-risk sites (aRR 1.69, 95% CI 0.90-3.17) and urban sites (aRR 1.46, 95% CI 0.71-2.98) compared to the control group, adjusted for potential confounders.
CONCLUSIONS: This trial showed no significant impact on HSV-2 incidence among AGYW. While the intervention appears to have reduced HSV-2 incidence among AGYW in rural, low-risk communities this effect was not observed in other communities. Economic activities in urban and rural high risk (mining) communities may have undermined the impact of CT.

PREVALENCE OF MALE CIRCUMCISION IN FOUR WESTERN KENYA COUNTIES AFTER 10 YEARS OF VOLUNTARY MEDICAL MALE CIRCUMCISION PROGRAM

E. Odoyo-June[1], N. Owuor[2], S.M. Davis[3], C. Laube[4], J. Wambua[2], P. Musingila[1], A. Aoko[5], Z. Mwandi[2], L. Soo[6], P. Young[6], R. Joseph[5], N. Talam[7], T. Lucas[8], C. Toledo[8], A. Juma[9]
[1]U.S. Centers for Disease Control and Prevention (CDC), DGHT, Nairobi, Kenya, [2]Jhpiego, VMMC quality support program, Nairobi, Kenya, [3]U.S. Centers for Disease Control and Prevention (CDC), Atlanta, United States, [4]Jhpiego, VMMC Project IQ, Baltimore, United States, [5]U.S. Centers for Disease Control and Prevention (CDC), Nairobi, Kenya, DGHT, Nairobi, Kenya, [6]USAID, Nairobi, Kenya, [7]US department of defense Kericho Kenya, South Rift Valley HIV program,, Kericho, Kenya, [8]U.S. Centers for Disease Control and Prevention (CDC), Atlanta, GA USA, DGHT, Atlanta, United States, [9]Ministry of Health, National AIDS and STI Control Program (NASCOP), Nairobi, Kenya

BACKGROUND: Since 2016, Kenya has used the Decision Makers Program Planning Tool, Version 2 (DMPPT2) annually to estimate male circumcision (MC) prevalence, guide program targeting, and project its impact. DMPPT2 is a compartmental model that applies the number of planned or reported circumcisions to baseline MC prevalence data to estimate changes in MC prevalence. However, outputs for Kenya have included implausible prevalence estimates above 100% in age bands where uptake of MC remains high. We conducted a cross-sectional survey in four counties in western Kenya to generate better MC prevalence estimates by age bands for program planning.
METHODS: The survey was conducted in Siaya, Kisumu, Homa Bay and Migori counties (July–September 2019). We used stratified two-stage cluster sampling to select 6,028 households. Resident boys/men aged 10–29 years who assented/consented were asked about their circumcision status. Circumcision status was verified for respondents who consented to genital examination. We calculated survey-adjusted MC prevalence by age category and county and agreement between self-reported and physically verified MC status using Cohen's kappa statistic. P values <0.05 were considered statistically significant.
RESULTS: Per self-report, MC prevalence among boys aged 10–14 years was 64.3% (95% confidence interval [CI]: 59.2–69.1) overall and ranged from 55.3% (95% CI: 40.2–69.5) in Migori to 74.9% (95% CI: 68.8–80.2) in Siaya. Prevalence in men aged 15–29 years was 79.2% (95% CI: 76.1–82.1) overall; Homabay, 75.6% (95% CI: 69.0–81.2); Kisumu, 77.9% (95% CI: 73.1–82.1); Siaya, 80.3% (95% CI: 73.7–85.5); and Migori, 85.3% (95% CI: 75.3–91.7). Nearly all respondents (99.2%) consented to physical verification of their circumcision status with agreement of 99% between self-reported and verified status (kappa agreement, p<0.0001).
CONCLUSIONS: Our results show the accuracy of self-reported MC status and lower MC prevalence than 2019 DMPPT2 estimates which were 94-142% for 10-14-year age-band and 94-105% for 15-29-year age-band. Reviewing the model assumptions and verifying inputs in DMPPT2 could improve the validity and utility of its circumcision prevalence estimates. Circumcision prevalence surveys can be used to validate and correct DMPPT2 inputs especially for mature programs whose MC uptake are inconsistent with DMPPT2 estimates.

LBPEC20

OUTCOMES ALONG THE HIV CARE CONTINUUM AMONG MEN WHO HAVE SEX WITH MEN IN HAITI

W. Dunbar[1,2], Y. Coppieters[2]
[1]Les Centres GHESKIO, Port-au-Prince, Haiti, [2]Université libre de Bruxelles, Ecole de Santé Publique, Belgium, Belgium

BACKGROUND: The HIV epidemic in Haiti continues, with an estimated 160,000 people living with HIV at the end of 2019. Although HIV prevalence in the general population is estimated to be 2.0%, certain groups are at a higher risk of HIV infection. The prevalence of HIV among men who have sex with men (MSM) is estimated to be 12.9%. As previous data have found gaps in HIV care for this population, we explored the steps in the continuum of care to determine outcomes at each step.
METHODS: We used an observational retrospective cohort study design to follow up MSM diagnosed with HIV in the largest HIV care clinic in Port-au-Prince, Haiti. Estimates were calculated of proportions of participants reached, tested, linked to care, commencing treatment, adherent to treatment, and who achieved virologic suppression. We identified factors associated with loss to follow-up at each step using multivariable analysis.
RESULTS: Data were collected between January 1, 2015, and December 31, 2019. 5009 MSM were reached for prevention services. Of those reached, 2499 (49.8%, 95% CI 48.5–51.3) were tested for HIV, 222 (8.8%, 95% CI 7.8-10.0) had a positive test result for HIV, and 172 (77,47%, 95% CI 71.4-82.8) were linked to HIV care. Among participants who started care, 54 (44.6 95% CI 24.5-38.9) were retained and 98 (78.4%, 95% CI 49.2–64.5) achieve a suppressed viral load. Fifty-nine (44.8%, 95% CI 27.2-41.9) were lost to follow-up. Participants who had been younger, with lower educational and economic levels were significantly less likely to achieve retention and viral suppression (p=0.001).
CONCLUSIONS: HIV cascade data among MSM in Haiti show very poor rates of retention in treatment although those retained had good virologic outcomes. Characteristics associated with LTFU suggest an urgent need to develop and implement effective interventions to support patients in achieving retention and viral suppression among MSM living with HIV.

LBPEC21

CHARACTERIZING RECENT INFECTIONS AMONG PERSONS WITH NEW HIV-1 DIAGNOSES IN MALAWI

M. Msukwa[1], S. Gugsa[2,1], J. Theu[1], I. Namakhoma[1], D. Payne[3], K. Curran[4], M. Arons[4], K. Namachapa[5], N. Wadonda-Kabondo[3], T. Dobbs[4], V. Shanmugam[4], E. Kim[3], A. Auld[3], Y. Babaye[1,2], G. O'Malley[2,1], R. Nyirenda[5], G. Bello[1,6]
[1]International Training and Education Center on Health, Recency Surveillance Program, Lilongwe, Malawi, [2]University of Washington, Department of Global Health, Seattle, United States, [3]Centers for Disease Control and Prevention, Lilongwe, Malawi, [4]Centers for Disease Control and Prevention, Atlanta, United States, [5]Malawi Ministry of Health, Department of HIV/AIDS, Lilongwe, Malawi, [6]Malawi Ministry of Health, Epidemiology Unit, Lilongwe, Malawi

BACKGROUND: In 2019, the Malawi Ministry of Health established a new surveillance system to detect and characterize recent HIV-1 infections among persons with new diagnoses. The system utilizes a recent infection testing algorithm (RITA): a rapid test for recent infection (RTRI) and viral load (VL) testing for recent RTRI results to classify the infection as long-term or recent based on viral suppression status. This study aimed to evaluate the uptake of RITA and describe populations with ongoing HIV transmission.

METHODS: We abstracted routine HIV-testing data and RTRI results from 97 health facilities in 11 districts (June 2019-February 2020). Consenting clients aged ≥13 years with new HIV-1 diagnoses were tested with Asante™ HIV-1 Rapid Recency Assay. Participants with RTRI recent test results provided dried blood spot specimens for VL testing; recent infections were defined as those having recent RTRI results with VL ≥1000 copies/mL.

We calculated frequencies and proportions of RITA recent infections by age, sex, pregnancy status, and district. P-values <0.05 were considered statistically significant.

RESULTS: Most eligible persons (97.5%) consented to recency testing (10353/10616). Overall, the recent HIV-1 infection rate was 3.7% (confidence interval [CI]: 3.4%-4.1%), with 40% of recent infections observed in clients aged 25-35 years. Recent infection rate was 4.3% (CI: 3.8%-4.8%) among women versus 2.8% (CI: 2.3%-3.4%) among men (p<0.0001). Recent HIV-1 infection rate was highest (7.7%) among younger women aged 13-19 years (CI: 5.7%-10.3%; p<0.0001). The recent infection rate did not significantly differ between pregnant and non-pregnant women. Among all tested men, recent HIV-1 infection rate was significantly higher (5.5%) in those aged 20-24 years (CI:3.5%- 8.7%; p=0.004), compared to men in other age groups. Comparatively, recent HIV-1 infection rate was highest (7.7%) among younger (13-19 years old) women (CI:5.7%-10.3%; p<0.0001). The recent HIV-1 infection rate in Blantyre (3.0%) was significantly lower than in Zomba (3.5%), Chikwawa (6.5%) and Machinga districts (7.2%) (p<0.0001).

CONCLUSIONS: Malawi's novel recent HIV-1 infection surveillance system demonstrated high uptake and identified cases with new infections. Women are likely being infected and diagnosed at younger ages than men, suggesting the need for targeted prevention efforts and active case finding among men for earlier diagnosis.

LBPEC22

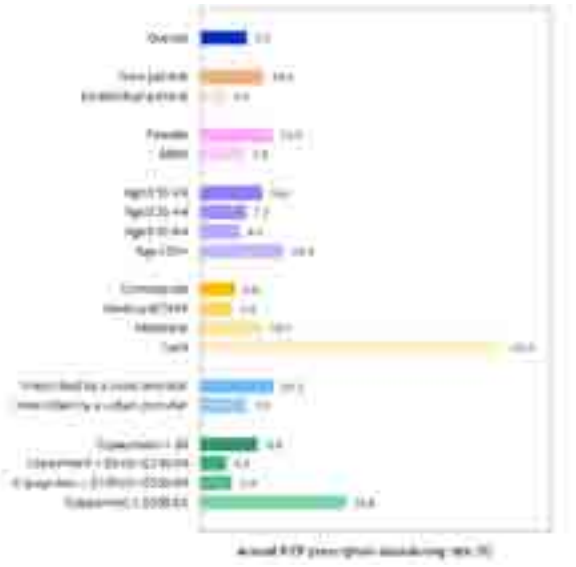
PREP PRESCRIPTION ABANDONMENT AT THE PHARMACY, UNITED STATES, 2018

Y.A. Huang[1], W. Zhu[2], N. Carnes[2], K. Hoover[2]
[1]Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Atlanta, United States, [2]Centers for Disease Control and Prevention, Atlanta, United States

BACKGROUND: After medication for HIV preexposure prophylaxis (PrEP) is prescribed by a provider and filled by a pharmacy, the patient must pick up the medication at the pharmacy. The frequency of persons with a filled PrEP prescription but did not pick it up, or abandoned it, is unknown. We analyzed a national pharmacy database to examine PrEP prescription abandonment.

METHODS: We analyzed 2018 data in the IQVIA pharmacy database. Among persons with a filled PrEP prescription, we identified those who abandoned it. Using a probit multivariable regression model, we estimated the frequency of prescription abandonment and associated factors, including patient demographic characteristics, provider location, payer type, and copayment amount.

RESULTS: In 2018, among 195,061 PrEP patients included in the analysis, 15,472 (7.9%) abandoned their PrEP prescription. Abandonment was higher among new PrEP patients, women, persons aged <25 years or >65 years, cash payers, and persons with a high copayment (Figure). After adjusting for covariates, we found that new PrEP patients were 1.4 times as likely as established PrEP patients to abandon their prescriptions (adjusted relative risk (aRR)=1.41, p<.001). Compared to commercially insured patients, PrEP patients who paid with cash were 3.1 times as likely to abandon their prescriptions (aRR=3.09, p<.001). In addition, patients with an average copayment >$500 per 30 pills were more likely to abandon their prescriptions (aRR=2.02, p<.001), as were those who were prescribed PrEP by a rural provider (aRR=1.25, p<.001).



[Figure. Percentage of patients (N=195,061) with an abandoned PrEP prescription - United States, 2018

CONCLUSIONS: We identified PrEP prescription abandonment as an opportunity to intervene to improve PrEP uptake and adherence. More than half of persons who paid with cash abandoned their PrEP prescription, suggesting that cost is a key barrier to accessing PrEP. The DHHS "Ready, Set, PrEP" program provides PrEP at no cost for eligible persons and can help overcome the high cost of PrEP medication as a barrier to its use.

LBPEC23

COVID-19 IN THE LARGEST US HIV COHORT

L.S. Park[1], C.T. Rentsch[2], K. Sigel[3], M. Rodriguez-Barradas[4,5], S.T. Brown[6,3], M.B. Goetz[7,8], E.C. Williams[9,10], K. Althoff[11], N. Bräu[6,3], L. Aoun-Barakat[12], A. Tseng[13,14], A.C. Justice[15,12], J.P. Tate[15,12]

Sinai, New York, United States, [4]Michael E. DeBakey Veterans Affairs Medical Center, Houston, United States, [5]Baylor College of Medicine, Houston, United States, [6]James J. Peters Veterans Affairs Medical Center, Bronx, United States, [7]Veterans Affairs Greater Los Angeles Healthcare System, Los Angeles, United States, [8]David Geffen School of Medicine, University of California Los Angeles, Los Angeles, United States, [9]VA Puget Sound, Seattle, United States, [10]University of Washington, Seattle, United States, [11]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [12]Yale University School of Medicine, New Haven, United States, [13]Toronto General Hospital and Faculty of Pharmacy, Toronto, Canada, [14]University of Toronto, Toronto, Canada, [15]VA Connecticut Healthcare System, West Haven, United States

BACKGROUND: Immunocompromised persons are at higher risk of poorer SARS-CoV-2/coronavirus disease 2019 (COVID-19) outcomes. The CDC considers persons with HIV (PWH) a special high-risk population and stated, "at present time, we have no specific information about the risk of COVID-19 in [PWH]".[1] We examined COVID-19 testing and outcomes in PWH and uninfected persons in the Veterans Aging Cohort Study (VACS), the largest cohort of PWH in the United States.

METHODS: VACS is an open cohort of all Veterans with HIV and 1:2 age-, race/ethnicity-, sex-, and site-matched uninfected Veterans. We extracted COVID-19 laboratory testing results and diagnoses reported through May 17, 2020 and linked demographics, outpatient/inpatient encounters, diagnoses, procedures, health behaviors, and pharmacy records from Veterans Health Administration (VA) electronic health records. Baseline was defined as date of specimen collection, hospital admission, or reported external testing. We estimated associations between baseline characteristics and testing COVID-19-positive (COVID-19+) with logistic regression and associations between HIV and severe COVID-19 (i.e., intensive care, intubation, or death) with Cox regression.

RESULTS: Among VACS participants alive in 2020 (30,948 PWH, 76,618 uninfected), 4.8% of PWH and 3.6% of uninfected engaged in COVID-19-related VA care (Figure 1). Over a 78-day period, 189 PWH (12.7% of tested) and 380 uninfected (13.9%) were diagnosed with COVID-19 (Table 1, adjusted odds ratio [OR]: 1.04, 95% CI: 0.85-1.26). PWH and uninfected COVID-19+ patients had similar distributions of baseline characteristics. Elevated risk for non-Hispanic black (OR: 1.87, 95% CI:1.49-2.36) and Hispanic (OR: 1.57, 95% CI: 1.11-2.22) patients compared to non-Hispanic white was similar for PWH and uninfected (p-interaction=0.47). Risk of severe COVID-19 outcomes was similar by HIV status (adjusted hazard ratios were approximately 1.00 for all outcomes).

CONCLUSIONS: While PWH have higher testing rates, thus far, we have not found evidence of increased burden of positivity among those tested, nor an increased risk of severe COVID-19 outcomes by HIV status. Due to testing shortages and potential for differential adherence to stay-at-home guidance by immunosuppression status, we should continue to monitor testing, positivity, and COVID-related health outcomes. Additionally, potential linkages between antiretroviral treatment and CD4 count with COVID-19 severity and progression needs investigation.

LBPEC24

HIGH RISK PREGNANT WOMEN INITIATION AND PERSIST ON PREP IN CAPE TOWN, SOUTH AFRICAN COHORT

D. Joseph Davey[1], L.-G. Bekker[2], N. Mashele[3], Y. Qayiya[4], P. Gorbach[1], T. Coates[5], L. Myer[4], PrEP-PP Study Group
[1]University of California Los Angeles, Epidemiology, Los Angeles, United States, [2]Desmond Tutu HIV Foundation, Cape Town, South Africa, [3]University of Cape Town, Cape Town, South Africa, [4]University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa, [5]University of California Los Angeles, Los angeles, United States

BACKGROUND: Pre-exposure prophylaxis (PrEP) is an important prevention intervention during pregnancy and breastfeeding, but there are no experiences implementing PrEP for high-risk pregnant/breastfeeding women in South African clinics.

METHODS: PrEP-PP is a cohort of HIV-negative pregnant and postpartum women recruited at their first antenatal visit in a community with high antenatal HIV prevalence. We screen HIV-uninfected pregnant women for eligibility criteria, followed by an interviewer-delivered survey that asks participant socio-demographics, relationships, partner serostatus, intimate partner violence, substance use and depression. We test women for sexually transmitted infections (STI) (Cepheid-GeneXpert). We compare women who took PrEP to those who did not, and persistence at 1 and 3-months after PrEP start from the first seven-months of the PrEP-PP cohort.

RESULTS: From Aug'19-Mar'20, we recruited and enrolled 374 HIV-uninfected pregnant women at first antenatal visit (median gestation, 21w [IQR=14-28]; median age, 25y [IQR=22-31]). Overall 92% of enrolled women opted to start PrEP at their first antenatal visit (n=344). Women who self-selected to start PrEP had the following characteristics vs. those who did not take PrEP: 38% diagnosed with a STI (vs. 30%), 49% reported recent alcohol or drug use (vs. 40%), 6% reported depression/anxiety during pregnancy (vs. 3%), 11% reported intimate partner violence (vs. 3%), 2% reported >1 sex partners (vs. 0%), 1% reported HIV-positive partners (vs. 0%) (Table 1). At 1m, 68% of women, at 3m 69%, returned for study visits. At 1m follow-up, 89% and at 3m follow-up 85%, reported taking PrEP >5 days in the past week. Half of women on PrEP reported side effects at 1m, predominantly nausea (33%), vomiting (15%) and dizziness (14%).

	On PrEP (n=344)		Not on PrEP (n=30)	
	n	%	n	%
STI diagnosis (chlamydia, gonorrhoea, trichomonas vaginalis)	129	38%	9	30%
Depression/anxiety in pregnancy	19	6%	1	3%
HIV+ partner	4	1%	0	0%
Partner HIV status unknown	81	24%	7	23%
Reported IPV in past year	37	11%	1	3%
Reported alcohol/drug use in past year	169	49%	12	40%

[Table 1. Risk factors by PrEP use/non-use in pregnant women]

CONCLUSIONS: Higher risk pregnant women are enrolling in PrEP study and starting PrEP during antenatal care. Retention and reported persistence were high compared to other populations, although side effects are frequently reported and need to be managed.

LBPEC25

PRE-EXPOSURE PROPHYLAXIS RETENTION AND PERSISTENCE FOR HIGH-RISK PREGNANT WOMEN DROP SIGNIFICANTLY DURING COVID-19 LOCKDOWN IN SOUTH AFRICA: IMPLICATIONS FOR HIV PREVENTION PROGRAMS

D. Joseph Davey[1,2], L.-G. Bekker[3], N. Mashele[2], P. Gorbach[1], T. Coates[4], L. Myer[2], PrEP-PP Study Group
[1]University of California Los Angeles, Epidemiology, Los Angeles, United States, [2]University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa, [3]Desmond Tutu HIV Foundation, Cape Town, South Africa, [4]University of California Los Angeles, Los angeles, United States

BACKGROUND: HIV risk is high during pregnancy and breastfeeding. Pre-exposure prophylaxis (PrEP) is an important prevention intervention during these periods. We sought to evaluate the impact of the lockdown on the study retention and PrEP prescriptions among pregnant/breastfeeding women.

METHODS: PrEP-PP is a cohort of HIV-negative pregnant and postpartum women recruited at their first antenatal visit at a primary care clinic in Cape Town and followed until 12m posptartum (launched Aug-19). HIV-uninfected pregnant women are screened for eligibility criteria, followed by an interviewer-delivered survey. Women decide if they want to take PrEP or not at each study visit. We compare study retention and PrEP prescription before COVID-19 lockdown on March 26, 2020 and during the lockdown using logistic regression.

RESULTS: From Aug'19-May'20, we enrolled 422 HIV-uninfected pregnant women at first antenatal visit (median gestation, 21 weeks [IQR=14-28]; median age, 25 years [IQR=22-31]). Overall 91% of enrolled

women opted to start PrEP at their first antenatal visit; most common reason was to prevent infant HIV. Prior to lockdown, study retention was 71% at 1m, and 59% at 3m. Following the lockdown, retention decreased significantly to 37% at 1m and 45% at 3m. Overall, retention was 63% in pre-COVID lockdown vs. 42% during lockdown. Odds of missing a study visit was 2.36 (95% CI=1.73-3.16) during the COVID-19 lockdown vs. before. Common barriers to study attendance was fear of COVID infection (for self/infant), limited transportation, and long queuing at facility.

	1-month visit			3-month visit		
	Attended	Missed	% retained	Attended	Missed	% retained
Pre COVID lockdown (Aug 15, 2019-Mar 26, 2020)	207	84	**71%**	113	80	**59%**
During lockdown (Mar 27-May 15)	19	32	**37%**	51	62	**45%**
Total	Attended	Missed	% retained			
Pre-lockdown	340	201	**63%**			
During lockdown	110	152	42%			

[Table 1. Retention in PrEP in pregnancy study before COVID-19 lockdown and during lockdown, Cape Town, South Africa (n=422 women) Bold: p<0.01]

CONCLUSIONS: PrEP refills and study visits dropped by 33% during the COVID lockdown. Pregnant women at high risk of HIV acquisition who are on PrEP cited fear of COVID infection and contact with health facility as common barriers. Community based PrEP delivery and phone interviews are needed to address barriers to attending facility-based PrEP prescription and study visits.

BACKGROUND: HIV outbreaks have occurred recently among people who inject drugs (PWID). Areas with recent HIV outbreaks among PWID may be particularly vulnerable for increased HIV/HCV transmission due to disruptions in HIV prevention services. We assessed the impact of COVID-19 on HIV/HCV prevention services in 12 sites with recent HIV outbreaks among PWID.

METHODS: Sites were included that detected HIV outbreaks among PWID during 2011–2019, in Europe, North America and Israel. Participating sites responded to a questionnaire about the impact of COVID-19 on service delivery for HIV/HCV and substance use disorder for PWID.

RESULTS: COVID-19 restrictions started 12–27 March in all sites. Opioid substitution treatment (OST), needle and syringe programmes (NSP) and antiretroviral treatment (ART) services continued, but most sites reported reductions in services and changes in operation. Service programmes reduced or suspended in-person client visits, counselling and new intakes due to social distancing policies. Service providers reported widespread difficulties for PWID to meet basic housing, food and hygiene needs due to severe economic challenges, changes in drug supply (associated in some sites with increases in overdoses, violence and acute mental health problems), increased homelessness, and one site mentioned increases in stigma toward the homeless. HIV, HCV testing, outreach and face-to-face research were halted or reduced, OST services reported treatment relapses while ART services reported some treatment interruptions and adherence problems. Services responded by introducing take-home medication for extended periods, providing syringes according to needs, long-acting OST, tele-health services and providing food and

shelter for homeless PWID. In some sites services that closed are being reopened. PWID were generally not screened for COVID-19 and only one site reported COVID-19 outbreaks among PWID.

CONCLUSIONS: COVID-19 has severely impacted HIV prevention services for PWID, likely resulting in an increased risk of HIV transmission among PWID in high-risk sites. Services have responded in innovative ways, often reforming entrenched policies. Essential services for PWID need to be sustained to prevent possible future HIV/HCV increases. Research and surveillance on HIV, HCV and COVID-19 among PWID will be key to detecting and responding to potential HIV, hepatitis or COVID-19 outbreaks among this vulnerable population.

LBPEC27

TEXT MESSAGING AND PEER COUNSELING FOR LINKAGE, ANTIRETROVIRAL THERAPY, AND VIRAL SUPPRESSION: A RANDOMIZED CLINICAL TRIAL AMONG NEWLY HIV-DIAGNOSED MEN WHO HAVE SEX WITH MEN IN BEIJING

H.-Z. Qian[1], Y. Xu[2], J. Tao[3], H. Spiegel[4], B. Shepherd[5], K.R. Amico[6], H. Liu[7], M. Peratikos[5], J. Simoni[8], Y. Ruan[9], Y. Shao[9], S. Vermund[1]
[1]Yale University, New Haven, United States, [2]Duke University, Durham, United States, [3]Brown University, Providence, United States, [4]Kelly Government Solutions, Rockville, United States, [5]Vanderbilt University, Nashville, United States, [6]University of Michigan, Ann Arbor, United States, [7]University of Maryland, College Park, United States, [8]University of Washington, Seattle, United States, [9]Chinese Center for Disease Control, Beijing, China

BACKGROUND: HIV continuum of care among Chinese men who have sex with men (MSM) is suboptimal. Text messaging and peer counseling are feasible interventions to promote HIV care in this population. We evaluated the efficacy of the combined intervention in a randomized clinical trial (ClinicalTrials.gov number NCT01904877).

METHODS: We randomly assigned 367 newly HIV-diagnosed MSM in Beijing to intervention or standard-of-care (SOC) arms. SOC included routine counseling and referrals for HIV care by the nearby Centers for Disease Control (CDC) clinics. Intervention arm participants received SOC plus enhanced support for engagement in HIV care through text message check-ins and five face-to-face sessions of peer counseling over 12 months. The primary outcomes of the trial were linkage to HIV care, initiation of ART, and viral suppression.

RESULTS: The combination intervention package significantly increased 12-month clinic follow-up visits: 93% in the intervention and 77% in the SOC arms (relative risk [RR] 1.20, 95% confidence interval [CI] 1.10-1.31; P<0.01), and uptake of plasma HIV-1 viral load testing: 80% in the intervention and 66% in the SOC arms (RR 1.15, 95% CI 1.02-1.31). Intervention participants were more likely to initiate ART than SOC participants (RR 1.18, 95% CI 1.02-1.37), particularly among the subgroup with CD4 count ≥350 cells/μL (RR 1.31, 95% CI 1.03-1.68). The rates of linkage to care (92% in the intervention versus 87% in SOC, P=0.11) and self-reported 4-day ART adherence (98% versus 100%, P=0.22) were high in both arms. The interventions did not have significant impact on HIV viral suppression within 12-month follow-up (53% versus 53%, P=0.55).

CONCLUSIONS: Peer-led text message outreach and face-to-face counseling interventions substantially increased 12-month clinical follow-up visits, viral load testing, and ART initiation. This combination strategy is promising for improving HIV care uptake among MSM. More robust interventions will be needed to achieve better viral load suppression.

IMPLEMENTATION OF A SARS-COV-2 COMMUNITY SCREENING PROGRAM BY THE LARGEST PROVIDER OF PREP AND HIV CARE IN THE MIDWEST

M. Pyra[1,2], L. Rusie[1], E. Etshokin[1], M. Green[1], M. Houlberg[1], J. Montgomery[3], C. Balthazar[4], K. Keglovitz-Baker[1], D. Munar[1], J. Schneider[1,2,5]
[1]Howard Brown Health, Chicago, United States, [2]University of Chicago, Chicago, United States, [3]Project Vida, Chicago, United States, [4]Taskforce Prevention & Community Services, Chicago, United States, [5]Chicago Center for HIV Elimination, Chicago, United States

BACKGROUND: Community-oriented COVID-19 screening has the opportunity to identify and engage highly impacted communities that may not access traditional emergency room or hospital care during the coronavirus epidemic. In Chicago Illinois, Howard Brown Health collaborated with TaskForce Prevention and Community Services and Project Vida to transition walk-in STI screening and community outreach programs into high-throughput community-based screening sites starting March 13, 2020.

METHODS: Data was abstracted from the electronic medical record of seven non-clinical screening locations adjacent to existing clinics, including two mobile screening sites over 10 weeks from 13/3/20 to 22/5/20. Descriptive statistics were performed on all clients screened using RT-PCR during this period, with additional data presented on existing clinic patients who were screened.

RESULTS: A total of 5796 tests were performed for 5741 unique individuals over the 10 week analytic period. Average age was 43 (range 1-97), 46% were Latinx and 14% were Black/African American. The SARS-CoV-2 positive test percentage was 31% (1802/5796 [95% CI 30%-32%]) with highest percentages among Latinx (45% [95% CI 43%-47%]) populations followed by Black/African American (17% [95% CI 14%-19%]) and non-Hispanic whites (14% [95% CI 9%-16%]). Positive percentages varied by age ranging from 18% (95% CI 16%-21%) among >60 to 36% among 11-19 (95% CI 30%-42%). Of 948 existing clinic patients with 984 tests, positivity was 19% (95% CI 16%-21%). Rates were highest among Latinx patients (25% [95% CI 20%-31%]) but mostly similar by age, BMI (among adults), and gender. There was no difference by HIV status, 17% (95% CI 12%-24%) among 156 PLWHIV and 19% (95% CI 16%-22%) among 828 HIV-negative patients.

CONCLUSIONS: Through partnerships with community-based organizations TaskForce and Project Vida Inc., HBH was able to reach beyond its client base to engage a diverse population in SARS-CoV-2 screening, finding high positivity rates among Latinx populations. Screening sites need to be flexible and located in most impacted communities and populations, including sub-populations like the undocumented, who experience limited access to the US health care system. Future work will include modeling to determine key factors of positivity, given the observational nature of this work, and follow-up outcomes among those with COVID-19.

SITE-RANDOMIZED CONTROLLED TRIAL OF A COMBINED COGNITIVE BEHAVIORAL THERAPY AND A MEDICATION MANAGEMENT ALGORITHM FOR TREATMENT OF DEPRESSION AMONG YOUTH LIVING WITH HIV IN THE UNITED STATES

L. Brown[1], M. Chernoff[2], B. Kennard[3], G. Emslie[3], D. Shapiro[4], K. Lypen[5], S. Buisson[5], A. Weinberg[6], L. Whiteley[1], S. Traite[2], C. Krotje[7], L. Harriff[7], E. Townley[8], P. 2002 Team[9]
[1]Brown University; Rhode Island Hospital, Psychiatry and Human Behavior, Providence, United States, [2]Harvard T.H. Chan School of Public Health, Center for Biostatistics in AIDS Research, Boston, United States, [3]University of Texas Southwestern Medical Center, Psychiatry, Dallas, United States, [4]Harvard T.H. Chan Shool of Public Health, Center for Biostatistics in AIDS Research, Boston, United States, [5]FHI 360, Durham, United States, [6]University of Colorado Denver Anshutz Medical Center, Aurora, United States, [7]Frontier Science Foundation, Amherst, United States, [8]National Institute of Allergy and Infectious Diseases, Rockville, United States, [9]International Maternal, Pediatric, Adolescent AIDS Clinical Trials (IMPAACT) Network, Rockville, United States

BACKGROUND: U.S. youth living with HIV (YLWH) have high rates of depression. Studies suggest that manualized, measurement-guided treatment is more efficacious than usual care. This study tests this treatment model for depression among U.S. YLWH, ages 12- 24 years in care at sites of the International Maternal Pediatric Adolescent AIDS Clinical Trials Network. Outcome data became available March 23, 2020.

METHODS: Using restricted randomization, 14 participating sites were assigned to either a 24-week, combination cognitive behavioral therapy and medication management algorithm (COMB-R arm) tailored for YLWH or to Enhanced Standard of Care (ESC arm), which provided standard psychotherapy and medication management. Primary outcome measures included depressive symptoms evaluated using the 19-question Quick Inventory for Depression Symptomatology Self-Report (QIDS-SR) collected through audio computer-assisted interviews, HIV viral load, and CD4 count. Eligibility included diagnosis of nonpsychotic depression and current depressive symptoms (score ≥ 11 on clinician-rated QIDS-C). Arm comparisons used t-tests on site-level means.

RESULTS: Six COMB-R and seven ESC sites (one site withdrew) enrolled 156 YLWH, with a median of 13 per site (range 2-16). At baseline there were no significant differences between arms on demographic factors, severity of depression, or HIV status. Across all sites, the average mean age was 21 years (22% ≤ 18 years); 45% of youth at each site were male, 61% were black, and 53% had acquired HIV through perinatal transmission. At Week 24, youth at the COMB-R sites, compared to ESC sites, reported fewer depressive symptoms, (mean QIDS-SR score 6.7 vs. 10.6, difference -3.9, 95% CI -6.8, -0.9, p=0.01),had a greater proportion of participants with a treatment response (more than 50% reduction in QIDS-SR score from entry; 62.3% vs. 17.9%, p<0.001), and a greater proportion in remission (QIDS-SR score ≤ 5; 47.9% vs.17.0%, p=0.01). The site mean viral load and CD4 level were not significantly different between arms at Week 24. The proportions of participants with psychiatric hospitalization or suicide attempt were not significantly different between arms.

CONCLUSIONS: A 24-week manualized, measurement-guided psychotherapy and medication management algorithm tailored for YLWH was more effective in reducing depressive symptoms than standard care at HIV care clinics.

LBPED31

TELEPHONIC SUPPORT FOR PEOPLE LIVING WITH HIV WHO ARE NOT COPING WITH ART DURING THE COVID-19 PANDEMIC: LESSONS LEARNED FROM MEDÉCINS SANS FRONTIÈRES' RESPONSE IN SOUTH AFRICA

K.D. Arendse[1], T. Makeleni-Leteze[1], N. Mantangana[1], X. Nxiba[1], T. Dutyulwa[1], T. Flowers[1], I.T. Katz[2], A. Grimsrud[3], E. Roberts[4], T. Cassidy[1], K. Lebelo[1], C. Keene[1]
[1]Medécins Sans Frontières, Belgium Trust, Khayelitsha Project, Cape Town, South Africa, [2]Harvard Medical School, Boston, United States, [3]International AIDS Society, Geneva, Switzerland, [4]Western Cape Department of Health, Cape Town, South Africa

BACKGROUND: In 2018, Medécins Sans Frontières (MSF) and the Western Cape Department of Health implemented the "Welcome Service" in a primary care clinic in Khayelitsha, South Africa. This is a differentiated service delivery model to support people living with HIV (PLHIV) who need additional support taking antiretroviral therapy (ART), including clients who are virally unsuppressed or have disengaged from care (missed appointments or adherence difficulty). The package included linkage to care, medical management and psychosocial support. COVID-19 magnified socioeconomic barriers to engagement and impacted healthcare delivery; urgent adaptation to the Welcome Service was required in response.

DESCRIPTION: MSF adapted the Welcome Service to support ART engagement despite additional challenges, as support for viral suppression is a necessary component of the COVID-19 response. To reduce facility visits, clinics extended ART refills from 1 up to 2 months at re-engagement or if virally unsuppressed. MSF supported clients with telephonic follow-up before their next face-to-face visit at two months: a nurse reviewed clients' symptoms and a counsellor provided psychosocial support.

LESSONS LEARNED: Telephonic consultations provided a safety net for PLHIV at the Welcome Service-supported clinic in April 2020 while intervals between clinic visits were prolonged: a counsellor provided psychosocial support and a nurse asked about concerning symptoms, such as features suggesting immune reconstitution and ART side effects, and advised if clients needed to return to the clinic earlier. Fifteen clients were contacted: 8 were receptive to telephonic consultations with staff able to establish rapport over the phone, 1 refused phone contact because of HIV non-disclosure to their family and the remaining 6 were unavailable telephonically. Fewer clients than usual re-engaged with ART services during the COVID-19 lockdown. Additionally, these services required access to phones, airtime, and revision of administrative procedures to keep client notes confidential outside work premises.

CONCLUSIONS/NEXT STEPS: Timely adaptation of services to support engagement with ART was feasible with few structural changes. However, implementation and expansion may be limited by community acceptance of telephonic consultations, clients' availability telephonically, and access to phones, airtime and administrative procedures. Lessons could be applied to other public health concerns and inform the restructuring of healthcare services beyond the COVID-19 pandemic.

LBPED32

EFFECTS OF SOCIAL SUPPORT AND STIGMA ON PRE-EXPOSURE PROPHYLAXIS USE DISCLOSURE IN WOMEN WHO INJECT DRUGS

M. Felsher[1], K. Dutra[2], B. Monseur[3]
[1]Drexel University Dornsife School of Public Health, Department of Community Health and Prevention, Philadelphia, United States, [2]Thomas Jefferson University Hospital, Department of Obstetrics and Gynecology, Philadelphia, United States, [3]Stanford University Hospital, Department of Reproductive Endocrinology & Infertility, Stanford, United States

BACKGROUND: Due to the COVID-19 pandemic, syringe exchange programs have closed and there is reduced access to services across the country, raising concerns that current HIV outbreaks among people who inject drugs (PWID) will be exacerbated. Now more than ever innovative strategies are needed to prevent HIV among PWID, particularly women who inject drugs (WWID), who are disproportionately represented in new HIV cases. One such method is Pre-exposure Prophylaxis (PrEP), a highly effective yet underutilized HIV prevention strategy in WWID. There is a paucity of literature addressing PrEP use in WWID with even less data on how social networks affect consistent usage. This study evaluates how perceptions of social support and stigma within social networks impact PrEP use disclosure among WWID and peers.

METHODS: Eligible participants were WWID participating in a PrEP demonstration project in Philadelphia who had initiated PrEP. Participants completed a personal network survey that included measures of PrEP stigma and social support within social networks. The primary outcome variable was PrEP disclosure within relationships. Logistic generalized estimating equations (GEE) models were used to examine the bivariate and multivariable relationship between predictor and outcome variables.

RESULTS: Participants (n=39) named an average of 9.5 (SD±3.3) network members, resulting in a total of 371 relationships. WWID disclosed their PrEP use to 42.1% (n=156/371) of network members. WWID had increased odds of disclosing PrEP use to main romantic partners [AOR 3.9, 95% CI: 1.6-8.5] and those currently taking PrEP [AOR 3.3; 95% CI: 1.3-8.2]. Related to stigma, WWID had decreased odds of disclosure if the person would disapprove of PrEP use [AOR 0.3, 95% CI: 0.1-0.8]. Related to social support, WWID had increased odds of disclosure if the person could provide advice [AOR 1.9, 95% CI: 1.2-3.2] or pick up their medication from the pharmacy [AOR 1.3, 95% CI: 1.3-7.8].

CONCLUSIONS: WWID's social networks were sources of PrEP stigma and support, both of which impacted PrEP-use disclosure. Findings support the need for peer-based strategies, such as couples-based PrEP counseling, to increase support for PrEP adherence while reducing stigma. During a crisis, understanding how social networks affect HIV prevention is more important than ever.

LBPED33

RAPID INTEGRATION OF SELF-SAMPLING FOR CHLAMYDIA AND GONORRHEA TESTING AMONG MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN IN KEY POPULATION-LED HIV CLINICS IN THAILAND DURING THE COVID-19 OUTBREAK

R. Janamnuaysook[1,2], L. Himma[1], N. Thammajaruk[1], S. Promthong[1], N. Teeratakulpisarn[1], P. Thapwong[3], A. Phunkron[3], T. Sangpasert[4], C. Chinnawong[4], T. Pasansai[5], K. Singsakul[5], P. Getwongsa[1], A. Chancham[1], J. Kongkapan[1], T. Amatsombat[1], J. Rueannak[1], P. Chumnanwet[1], K. Samitpol[1,2], P. Srimanus[1], W. Ratanalert[1,2], N. Photisan[1], P. Mingkwanrungruang[1], O. Nampaisan[1], R. Ramautarsing[1], P. Phanuphak[6,1], N. Phanuphak[1,2]
[1]Institute of HIV Research and Innovation, Bangkok, Thailand, [2]Center of Excellence in Transgender Health, Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand, [3]Service Workers In Group Foundation, Bangkok, Thailand, [4]Rainbow Sky Association of Thailand, Bangkok, Thailand, [5]Mplus Foundation, Chiangmai, Thailand, [6]Thai Red Cross AIDS Research Centre, Bangkok, Thailand

BACKGROUND: Approximately 30% of men who have sex with men (MSM) and transgender (trans) women who accessed key population (KP)-led clinics in Thailand had chlamydia trachomatis (CT) and/or neisseria gonorrhea (NG) infection in 2017. However, uptake of CT/NG testing remains low, mainly due to privacy issues. The need to continue sexual health services during the COVID-19 outbreak while maintaining social distancing and occupational safety led to immediate integration of self-sampling for CT/NG testing for the first time among MSM and trans women. We report feasibility and testing yield from four KP-led clinics in Thailand partnering with the USAID/PEPFAR-funded LINKAGES project.

METHODS: Standard operating procedures for CT/NG testing self-sampling from the urethra, oropharynx, rectum, and neovagina were developed, used for virtual training, and implemented within one week. Demographic characteristics, self-sampling uptake, and CT/NG testing yield were collected from MSM and trans clients visiting the Tangerine Clinic, SWING, RSAT, and Mplus community health clinics in Bangkok and Chiang Mai March 02–May 15, 2020. Molecular CT/NG testing was performed on GeneXpert.

RESULTS: A total of 131 (77.5%) MSM and 38 (22.5%) trans women conducted self-sampling. Self-sampling acceptability varied by anatomical site: 100% for urine collection, 100% for rectum, 21% for neovagina, and 76.3% for oropharynx. Among MSM and trans women, 26.7% and 21%, respectively, tested HIV positive. In addition, 63.4% of MSM and trans women reported currently being on pre-exposure prophylaxis, engaging in sex work (14.2%), using injecting substances (10.4%), inconsistent condom use (52.8%), and condomless sex (8.3%), and 30.3% tested syphilis reactive. CT and/or NG were identified in 19.1% of MSM and 10.5% of trans women. There were no invalid test results.

CONCLUSIONS: Self-sampling for CT/NG testing was highly acceptable and feasible among MSM and trans women in Thailand. Self-collection can address privacy issues, a key barrier to CT/NG testing among Asian MSM and trans women, and can put them in charge of their own health. Our data support self-sampling as an alternative/additional sexual health service approach, which could eventually become a new normal. Client and provider perspectives and economic data are needed to efficiently scale up self-collection.

LBPED34

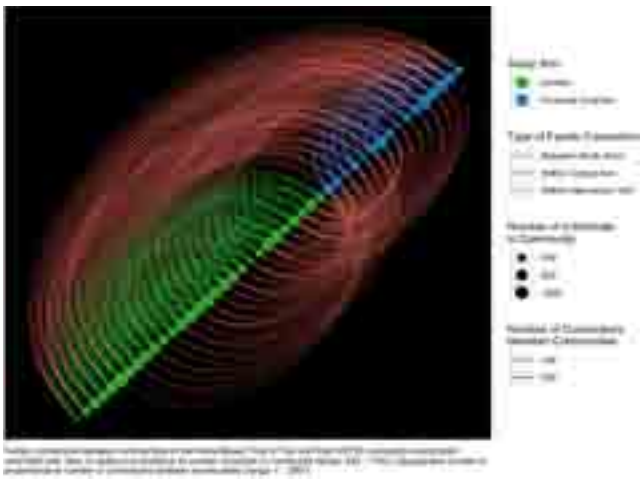
FAMILY NETWORK SPILLOVER IN A COMMUNITY-RANDOMIZED CONTROLLED TRIAL OF MICRO-INCENTIVES FOR HIV TESTING: EVIDENCE FROM THE HITS STUDY

K. Makofane[1], H.-Y. Kim[2,3], O. Adeagbo[3], N. McGrath[4,3], J. Seeley[5,3], M. Shahmanesh[3,6], M. Yapa[7], F. Tanser[3,8], T. Bärnighausen[9,3]
[1]Harvard University, Department of Social and Behavioral Sciences, Boston, United States, [2]New York University (NYU) School of Medicine, Population Health, New York, United States, [3]Africa Health Research Institute (AHRI), Durban, South Africa, [4]University of Southampton, Faculty of Social, Human and Mathematical Sciences, Southampton, United Kingdom, [5]London School of Hygiene & Tropical Medicine, Department of Global Health and Development, London, United Kingdom, [6]University College London, Institute for Global Health, London, United Kingdom, [7]University of New South Wales, The Kirby Institute, Sydney, Australia, [8]University of Lincoln, College of Social Science, Lincoln, United Kingdom, [9]University of Heidelberg, Institute of Public Health, Heidelberg, Germany

BACKGROUND: While incentives can increase HIV testing uptake, it is not known whether they have spillover effects among recipients' family members. Spillover might occur through transmission of information or resources through family networks. We measure family spillover effects of a community-randomized micro-incentive for HIV testing.

METHODS: The 'Home-Based Trial to Test and Start' (HITS) is a community-randomized controlled trial of 45 communities in Umkhanyakude, KwaZulu-Natal (ClinicalTrials.gov # NCT03757104). It is based in the Africa Health Research Institute's population-based HIV testing platform, which offers home-based HIV testing and collects information on family relationships among residents in the catchment area. All people aged ≥15 years in 16 randomly selected communities were offered a micro-incentive (R50 [$3] food voucher) for rapid HIV testing (intervention arm). Those living in the remaining 29 communities were offered testing only (control arm). To measure spill-over, we estimated the effect of the micro-incentive for people with and without family members in the intervention arm. Family relationships were ascertained using data on parent-child and romantic relationships. We used a linear probability model with robust standard errors for estimation.

RESULTS: 15,675 people participated in the HITS trial. Family relationships across study arms were common (Figure 1).



[Figure 1. Family connections between communities in HITS study]

As expected, compared to people living in control communities, people in intervention communities were more likely to have family members living in an intervention community (85.1% vs. 9.4%). Among people with no family members in the intervention arm, the micro-incentive increased HIV testing by 11.6% (95%CI 9.0-14.3%); among people with at least one family member in the treatment arm, the micro-incentive increased testing by 18.1% (95%CI 14.6-21.6%). Results were robust in a sensitivity analysis using a marginal structural model.

CONCLUSIONS: Micro-incentives appear to have substantial positive spillover effects within family networks. These effects support family- and community-based approaches for the design of incentives and other HIV interventions.

LBPED35

SOCIAL AND RACIAL DISPARITIES ARE ASSOCIATED WITH UNATTAINABILITY OF MAINTAINING SOCIAL DISTANCING DURING THE COVID-19 PANDEMIC AMONG MEN WHO HAVE SEX WITH MEN AND TRANSGENDER/NON-BINARY POPULATIONS IN BRAZIL

T.S. Torres[1], B. Hoagland[1], D.R.d.B. Bezerra[1], A. Garner[2], K. Geraldo[1], L. Freitas[1], S.W. Cardoso[1], E. Jalil[1], L.E. Coelho[1], A. Ramos[1], J. Freitas[1], M. Benedetti[1], C. Pimenta[3], B. Grinsztejn[1], V.G. Veloso[1]
[1]Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, [2]Hornet INC, Los Angeles, United States, [3]Ministry of Health, Brasilia, Brazil

BACKGROUND: Brazil adopted social distancing measures in March 2020 to avoid the spread of COVID-19 and the collapse of health system. Those measures may disproportionally affect individuals from sexual and racial minorities, as well as the poorest.

METHODS: Brazilian cisgender men who have sex with men (MSM) and transgender/non-binary people (age≥18y) were recruited through advertisements on Hornet, Facebook and WhatsApp to complete a web-based survey during April-May,2020. They answered questions on sociodemographic, HIV self-reported status, substance use, and impact of social distancing measures due to COVID-19 on personal life. We also assessed unattainability of maintaining social distancing due to any reason, such as work or housing challenges (yes/no). Logistic regression model was used to assess factors associated with that unattainability.

RESULTS: A total of 4289 individuals accessed the questionnaire and 3536(82%) completed it. Of these, 3453(98%) were cisgender MSM and 83(2%) transgender/non-binary. Median age was 33 years (IQR:27-40). Most lived in Southeast/South regions (3160; 89%) and completed secondary school or higher (2261; 64%). Black/mixed-black accounted for 44%(n=1541), 38%(n=1333) had low family income (<US$380/month), and 23%(n=811) self-reported HIV-positive status. Respondents reported challenges to access hand sanitizer (1222; 35%), food (457; 13%), health care (402; 11%), and transportation (676;19%). Almost 30%(n=1024) reported reduced income or working hours. Among those reporting alcohol use (1713; 48%), 24% increased its use during social distancing period.

Among those reporting illicit drug use (2738; 23%), 31% informed increased use. The majority were very afraid or afraid (2735;77%) of getting COVID-19. 63% of respondents were highly impacted by social distancing measures in their lives (n=2235), and 928(26%) were unable to maintain social distancing. Lower schooling (aOR1.52;95%CI:1.27-1.81), black/mixed-black race (aOR1.29;95%CI:1.10-1.51) and lower family income (aOR1.40;95%CI:1.11-1.78) were associated with unattainability to maintain social distancing when adjusted for age, gender, sexual orientation, region and HIV self-reported status.

CONCLUSIONS: The lives of minorities in Brazil have been highly impacted by social distancing measures, likely aggravating inequality factors in Brazil. Social and racial disparities are associated with unattainability in complying with social distancing among sexual minorities in Brazil. Tailored social and economic support policies during the COVID-19 pandemic should be made available to these individuals.

LBPED36

SEXUAL BEHAVIOR AND PREP USE AMONG SEXUAL MINORITIES DURING COVID-19 PANDEMIC IN BRAZIL

T.S. Torres[1], B. Hoagland[1], D.R.d.B. Bezerra[1], A. Garner[2], K. Geraldo[1], L. Freitas[1], S.W. Cardoso[1], E. Jalil[1], L.E. Coelho[1], J. Moreira[1], L. Monteiro[1], M. Benedetti[1], C. Pimenta[3], V.G. Veloso[1], B. Grinsztejn[1]
[1]Instituto Nacional de Infectologia Evandro Chagas, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, [2]Hornet INC, Los Angeles, United States, [3]Ministry of Health, Brasilia, Brazil

BACKGROUND: Social distancing measures implemented during the COVID-19 pandemic may affect HIV prevention by hindering access to HIV testing, linkage to prevention services and PrEP initiation. It is critical to understand the impact of social distancing on sexual behavior and PrEP use among sexual minorities in Brazil.

METHODS: Between April-May 2020, we conducted a national web-based survey advertised on Hornet, Facebook and WhatsApp to enroll people aged≥18y who identified as cisgender men who have sex with men (MSM) or as transgender/non-binary with self-reported HIV negative/unknown status. The questionnaire included topics on sociodemographics, sexual behavior during social distancing, and PrEP. PrEP eligibility criteria includes one of the following: condomless receptive anal sex, HIV-positive partner, and transactional sex.

RESULTS: Out of 3536 people who completed the questionnaire, 2725 were eligible: 2660(97.6%) MSM, 17(0.6%) transwomen, 12(0.4%) transmen, and 36(1.3%) non-binary. Median age was 32(IQR:26-40) years, 43%(n=1161) were black/mixed-black, 58%(n=1578) recruited on Hornet, 65%(n=1783) completed secondary school or higher, 76%(n=2081) had middle/high income. During the social distancing period, the number of sexual partners decreased for most of respondents (1736;64%) and increased for only 3%(n=89). Almost half reported no sex during this period (1282; 47%), 482(18%) had sex only with steady partners, and 986(36%) had sex with casual partners. Among these, apps were the most common way to find casual partners (653/986; 66%). A total of 26%(705/2725) were using daily oral PrEP before social distancing period. Among them, 69%(486/705) continued daily oral PrEP, 27%(193/705) stopped PrEP, 2%(11/705) used event-driven PrEP, and 2%(15/705) used different PrEP regimens. Main reasons for stopping PrEP were inability to pick up PrEP at the health service (88/193; 46%) and sexual abstinence (252/193; 27%). Among those who stopped PrEP, 33%(63/193) maintained PrEP eligibility and could have continued PrEP use if they had access to. Among those not on PrEP previously, 85% had heard about PrEP (1706/2020), and 22%(445/2020) were eligible to PrEP, among who 72%(322/445) would likely use PrEP.

CONCLUSIONS: The COVID 19 pandemic adds new challenges for HIV prevention. Innovative solutions are of utmost importance to guarantee PrEP access and to avoid a raise in HIV epidemic among most vulnerable groups.

LBPED37

MENTAL HEALTH IMPACT OF COVID-19 LOCKDOWN AND CONCERNS ABOUT CONTINUING HIV CARE AMONG OLDER PLWH IN UKRAINE

I. Zaviryukha[1], S. Shenoi[2], O. Zeziulin[1], T. Kiriazova[1], K. Rich[3], N. Kniazeva[4], O. Shipunov[5], Y. Minster[4], T. Orlova[4], N. Radich[5], N. Vyktyuk[4], E. Mamedova[4], V. Yariy[5], T. Litz[2], A. Allen[6], R. Araya[7], M. Pennington[7], J. Rozanova[2]
[1]Ukrainian Institute on Public Health Policy, Kiev, Ukraine, [2]Yale University, Internal Medicine, New Haven, United States, [3]Harvard University, School of Medicine, Cambridge, United States, [4]Kiev City Clinical Hospital Nº 5, Kiev, Ukraine, [5]Kiev city Narcological Hospital "Sociotherapy", Kiev, Ukraine, [6]State University of New York, Downstate, New York, United States, [7]King's College London, Population Health and Service Research, London, United Kingdom

BACKGROUND: Of 4.2 million older people with HIV (OPWH), defined as ≥50yo, 80% reside in low- and middle-income settings that experience unequal Covid-19 burdens on healthcare. Ukraine is a low-middle income country with increasing HIV incidence and mortality. Covid-19 has brought Ukraine under lockdown since March 2020, with scarce resources directed to fighting coronavirus epidemic. To understand the impact of Covid-19 pandemic on older patients, we surveyed OPWH receiving HIV care in Kyiv.

METHODS: From May 1-22, 2020 three interviewers administered a phone questionnaire to OPWH patients referred by clinicians from the Kyiv City AIDS Center and Kyiv City Addiction Treatment Clinic, entering answers into REDCap data management system. Participants' experiences of Covid-19 impact were analyzed using R statistical software.

RESULTS: Among 66 OPWH, 62% were women, median age was 56 yrs (SD 6.1), 42% were employed, 100% were prescribed ART, and 82% had comorbidities. During the lockdown, 28% were alone while 44% isolated with family, and 15% had Covid-19 exposure directly or through loved ones. Among OPWH, 75% had smartphones, 61% obtained Covid-19 information online, and 44% coped with lockdown by talk/video chats with family and friends. Almost half (46%) feared getting infected with Covid-19 and 15% worried about being able to continue HIV care. While 96% of OPWH reported ART adherence, 15% stopped medication for other chronic conditions. Mental health was an underrecognized problem: only 6% of participants felt anxious or depressed since lockdown, but PHQ9 and GAD7 scales revealed substantial (i.e. low-level and higher) depressive and anxiety symptoms respectively in 44% and 42% of participants, signifying that further mental health assessment would be advisable. Social support was another vulnerability domain: 10% of OPWH were left by partners during lockdown, 15% reported 1 or less persons in their support network, 23% have never disclosed their HIV status and 48% had nobody supporting their HIV care. Yet, 70% wished to support other OPWH.

CONCLUSIONS: As many OPWH live alone, lack people to support their HIV care, yet have high levels of smartphone use and willingness to support other OPWH, peer-based mHealth intervention can help OPWH remain on ART post-COVID-19-lockdown and improve mental health.

LBPED38

SURGING THROUGH THE COVID-19 PANDEMIC TO RETAIN PATIENTS ON ART: EXPERIENCES USING INNOVATIVE APPROACHES FOR ART DELIVERY IN LAGOS STATE, NIGERIA

F. Ogirima[1], O. Azurunwa[1], S. Batur[1], O. Abe[1], P. Egwumba[1], I. Ayo[1], P. Christopher-Izere[1], C. Imarhiagbe[1], M. Adeleke[2], R. Agbolagorite[3], B. Oyeledun[1]
[1]Center for Integrated Health Programs, Abuja, Nigeria, [2]Lagos State Agency for the Control of AIDS (LSACA), Lagos, Nigeria, [3]Lagos State Ministry of Health, Lagos, Nigeria

BACKGROUND: Nigeria's first COVID 19 case was identified late February in Lagos State and increased to 3093 by May 22, 2020. Lockdown imposed from late March to early May resulted in business closures/movement restrictions. Centre for Integrated health Programs (CIHP), with funding from PEPFAR/CDC provides comprehensive treatment services to 32,484 Persons living with HIV (PLHIV) across the state. We describe innovative experiences providing ARV refills to PLHIV during this period.
DESCRIPTION: Health facilities service disruption, fear of contracting the virus, harassment of patients/health providers by duty security operatives during lockdown, scarce transportation and funds paucity became critical challenges that affected program implementation. CIHP developed 5 key mitigation strategies for ART retention (novel drug-pickup modalities): i) activating CIHP satellite offices as temporary drug pick up centers to reduce the risk of COVID-19 transmission; ii) essential duty passes from the Health Ministry/AIDS Agency to facilitate movement and operations of health providers; iii) partnerships with community pharmacies and civil society organizations including Network of People living with HIV/AIDS and PATA, Positive Action for Treatment Access, for peer led deliveries iv) private logistics company for direct home deliveries as alternate channels for ART delivery in the communities v) palliative support. Call centers were established to reach PLHIV for preferred mode of delivery, assess quality of service and track those missed.
LESSONS LEARNED: Drug pick up rates for the different service delivery models accounted for 97% for all eligible patients for the intervention period. 95% of patients were satisfied with the drug delivery model using a Private Logistics Company. For all models, 100% confidentiality was maintained.
CONCLUSIONS/NEXT STEPS: Novel differentiated care models can improve access during lockdowns. Structured planning/ implementation of alternate ART delivery models will facilitate PLHIV retention, protect gains of HIV response and sustain progress towards achievement of the second/third 95% targets of UNAIDS.

LBPED39

FINANCIAL INSECURITY AND UNMET NEEDS AMONG PEOPLE LIVING WITH HIV DUE TO THE COVID-19 PANDEMIC: DEVELOPMENT OF A CRISIS RESPONSE MODEL IN A RYAN WHITE HIV/AIDS PROGRAM CLINIC

J. Sherbuk[1], B. Williams[1], K. McManus[1], R. Dillingham[1]
[1]University of Virginia, Divison of Infectious Diseases and International Health, Charlottesville, United States

BACKGROUND: Social determinants of health (SDH) contribute to health disparities among people living with HIV (PLWH). During the COVID-19 pandemic, record unemployment, economic impacts, and disruptions in healthcare access may exacerbate the impact of SDH on PLWH. We developed a model for a timely proactive crisis response aiming to (1) perform a rapid needs assessment among our clinic's most vulnerable PLWH and (2) address the escalating needs for support services during the initial weeks of the pandemic in April 2020.
DESCRIPTION: The University of Virginia Ryan White HIV/AIDS Program (RWHAP) clinic is located in the Southeastern U.S. and serves 863 PLWH. While our local region has not been overwhelmed by COVID-19 hospitalizations and mortality, many of our patients work in industries quickly impacted by COVID-19. Our model of rapid response included a needs assessment evaluating access to food, medications and care, assessment of mental health, and change in work. Patients at high risk for financial insecurity and increased needs were prioritized for assessment, including patients previously assigned a medical case manager or with income under 100% of the Federal Poverty Level. Additionally, we monitored changes in housing and food services provided by the clinic.
LESSONS LEARNED: During the 6-week period from mid-March through the end of April 2020, case managers performed needs assessments for 219 patients (25% of clinic patients). Among these patients at risk for financial insecurity, 66 of 90(73%) patients employed prior to COVID-19 reported their work was affected by COVID-19. During April 2020, food services and emergency housing support provided by the clinic increased 66% and 68%, respectively, compared to the prior monthly average.
CONCLUSIONS/NEXT STEPS: Among a group of patients suspected to be at high risk for being impacted by the COVID-19 pandemic, unmet needs were substantial. Given the ongoing pandemic and prolonged shelter-in-place orders, increased needs will persist over the coming months and will recur with second or third waves of COVID-19 infections. In the setting of large-scale crisis, preparation facilitates rapid response. For RWHAP, a proactive plan for urgent needs assessments could be included as part of the HRSA continuity of operations plan already required for RWHAP clinics.

LBPED40

USING DIFFERENTIATED MODELS OF CARE TO MAINTAIN GAINS IN ART RETENTION DURING THE COVID-19 PANDEMIC: LESSONS FROM A LARGE TREATMENT FACILITY IN TRINIDAD AND TOBAGO

N. Lyons[1], J. Edwards[1]
[1]Medical Research Foundation of Trinidad and Tobago, Port of Spain, Trinidad and Tobago

BACKGROUND: The Medical Research Foundation (MRF) is the largest HIV treatment facility in Trinidad and Tobago reporting over 9,000 patients ever linked to care. Beginning in 2017, the MRF achieved clinical success and expanded ART coverage, accounting for 75% of all persons on ART nationally. During the third week of March, the MRF implemented five complementary models of differentiated care to ensure the continuity of ART services during stay-at-home measures mandated by government to avert community spread of COVID-19 infections.
DESCRIPTION: By the third week in March (2020), the MRF implemented five complementary models of differentiated care to include (1) Modified appointment spacing facilitated through multi-month ART prescriptions; (2) ART delivery services facilitated by community groups (3) A rapid clinic triage offering fast track refills; (4) Expanded patient tracing to track missed ART pick-ups and; (5) a dedicated

phone line to provide psycho-social support for ART adherence. Data extracted from electronic patient records, call logs, and ART registries were collated and analysed to identify specific program gaps and barriers to patient retention on ART. Data was dis-aggregated to identify outcomes for sub populations.

LESSONS LEARNED: Data for January to March quarter showed 4,922 patients retained on ART, a 5% decrease from previous quarter (Sept –Dec 2019) . There was a 29% decrease in ART retention among Men who have sex with men (MSM) during January to March compared to the previous quarter. Data extracted from call logs showed an increase in missed appointments and patients reporting fears of the spread of COVID-19 infections and their HIV status. Other barriers included, transportation costs of attending clinic, and being too busy to attend scheduled ART picks. This data was subsequently used to develop and tailor five complementary models of differentiated care to address program gaps and patient specific barriers. Early program data results show a 15% increase in the number of prescriptions dispensed, and an increase in scheduled ART visits in April (once month after program implementation).

CONCLUSIONS/NEXT STEPS: The use of data to plan, implement, and monitor innovative models of differentiated care provide important lessons for HIV programs in maintaining gains in ART retention during the COVID-19 pandemic.

LBPED41

PSYCHOBEHAVIORAL CHANGES AND ALCOHOL USE DURING THE COVID-19 PANDEMIC AMONG PEOPLE LIVING WITH HIV

T. Ferguson[1], K. Theall[2], D. Welsh[3], P. Molina[4]
[1]Louisiana State University Health Sciences Center, Public Health, New Orleans, United States, [2]Tulane University, New Orleans, United States, [3]Louisiana State University Health Sciences Center, Pulmonology, New Orleans, United States, [4]Louisiana State University Health Sciences Center, Physiology, New Orleans, United States

BACKGROUND: Alcohol misuse to cope with stress and anxiety may be increasing during the COVID-19 pandemic. Heightened psychosocial and physiological stress is associated with poorer immune status, loss of viral suppression, and resulting chronic antigenic stress and immune activation associated with increased risk of comorbidities in PLWH. Our objective was to determine if PLWH who experience increased stress during COVID-19 will have had a statistically significant increased prevalence of alcohol and substance use.

METHODS: The New Orleans Alcohol use in HIV (NOAH) Study is a prospective follow up study of a clinic-based sample of in-care PLWH and HIV negative adults aged ≥18 years matched by age and sex under care recruited from clinic in New Orleans, Louisiana. Self-reported survey measures were obtained by phone interviews conducted among the current NOAH cohort participants and compared to baseline measures collected prior to the epidemic. Participants were asked about changes of lifestyle during the COVID-19 pandemic (i.e. living arrangement, job, and childcare), emotional response, perceived control and fatalism due to COVID-19, anxiety and depression.

RESULTS: Preliminary results of a subset of the NOAH cohort (n=201) during the current COVID-19 public health crisis, show that 18% of participants report using more alcohol, 27% more cigarettes, and 7% more drugs than prior. These early data also reveal that 47% are moderately to very much worried about the COIVD-19 pandemic, 32% are moderately to very much upset, and 39% are moderately to very much tense. Borderline to abnormal anxiety levels are being experienced in 45%. In addition, NOAH participants are reporting experiencing job loss (38%), worrying about having enough to eat (27%), and worrying about having a regular place to live (20%) due to COVID-19.

CONCLUSIONS: Stressful factors negatively impact pre-existing symptoms of stress, anxiety, and depression and may have unwanted consequences that contribute to morbidity and mortality of vulnerable populations during this COVID-19 pandemic. It is essential that we further examine these growing physical psychosocial stressors on the impact of AUD and recovery from COVID-19. Further data collection is and analyses are underway.

LBPEE42

PERCEIVED IMPLEMENTATION BARRIERS DECREASE DURING INITIAL STAGES OF THE FIRST IMPLEMENTATION SCIENCE HYBRID III STUDY (CUSTOMIZE) OF CABOTEGRAVIR AND RILPIVIRINE LONG-ACTING (CAB+RPV LA) IN US HEALTHCARE SETTINGS: HEALTHCARE TEAM PERSPECTIVE

M. Czarnogorski[1], C. Garris[1], P. Wannamaker[1], R. D'Amico[1], D. Merrill[1], C.A. McHorney[2], L. Stassek[2], S. Mansukhani[2], J. Flamm[3], B. Thedinger[4], P. Benson[5], M. Wolfeiler[6], G. Sinclair[7], W. Spreen[1]
[1]ViiV Healthcare, RTP, United States, [2]Evidera, Patient-Reported Outcomes, North Wales, United States, [3]Kaiser Permanente Sacramento, Sacramento, United States, [4]Kansas City Free Health Clinic, Kansas City, United States, [5]Be Well Medical Center, Detroit, United States, [6]AIDS Healthcare Foundation, Miami, United States, [7]PrismHealth North Texas, Dallas, United States

BACKGROUND: CAB+RPV LA administered monthly for HIV treatment can eliminate daily oral ART for some patients, but will require a paradigm shift in HIV care delivery with more frequent clinic appointments and resourcing/logistic changes. CUSTOMIZE, a novel prospective implementation science study, examined US provider perspectives of LA injectable ART prior to regulatory approval.

METHODS: Staff from diverse HIV care settings participated including Federally Qualified Healthcare Centers, universities, private practices, AIDS Healthcare Foundation, integrated managed-care consortium. Three providers from each site (physicians, injectors, administrators) completed surveys at Baseline (N=26) and Month 4 (M4) (N=24) evaluating acceptability (AIM), appropriateness (IAM), feasibility (FIM), and barriers to CAB+RPV LA implementation. Proportions and mean scores (higher scores more positive) were calculated for AIM, IAM, FIM.

RESULTS: Most staff (>84%) agreed/completely agreed that CAB+RPV LA was acceptable, appropriate and feasible at Baseline and M4 (Table 1) with some variability by provider type.

	All Staff Agreed/Completely Agreed % (Mean Score)		Physicians Agreed/Completely Agreed % (Mean Score)		Injectors Agreed/Completely Agreed % (Mean Score)		Administrators Agreed/Completely Agreed % (Mean Score)	
	Baseline N=26	M4 N=24	Baseline N=9	M4 N=8	Baseline N=9	M4 N=8	Baseline N=8	M4 N=8
AIM	91.4% (4.43)	91.6% (4.39)	86.1% (4.36)	96.9% (4.47)	94.5% (4.50)	90.6% (4.44)	93.8% (4.44)	87.5% (4.25)
IAM	99.1% (4.52)	94.8% (4.45)	100% (4.44)	93.8% (4.44)	100% (4.64)	100% (4.50)	96.8% (4.47)	90.6% (4.41)
FIM	90.4% (4.38)	84.4% (4.32)	91.6% (4.44)	84.4% (4.31)	94.4% (4.56)	84.4% (4.34)	84.4% (4.13)	84.4% (4.31)

AIM, IAM, FIM utilized a Likert Scale (1-5): 1=Completely Disagree, 2=Disagree, 3=Neither Agree nor Disagree, 4=Agree, 5=Completely Agree

[Table 1. Acceptability, Appropriateness, and Feasibility of the Intervention]

	Perceived Barrier at Baseline N=26, %*	Actual Barrier at Month 4 N=24, %*
Patient ability to keep monthly appointments	80.8	37.5
Patient transportation for monthly appointments	76.9	37.5
Flagging/awareness of missed injection visits	73.1	45.8
Staff Resourcing for clinic flow	53.8	37.5
Rescheduling missed injections	50.0	20.9
Patients failing CAB+RPV LA due to missed doses/injection visits	50.0	16.6
Management of patients presenting to injection visits with other care needs	50.0	33.4
Patient injection pain/soreness	46.1	41.7
*Proportion of clinic staff who Agreed or Completely Agreed, using a 1-5 rating scale where 1=Completely Disagree and 5=Completely Agree		

[Table 2. Top Rated Barriers to Implementation- All Staff]

CONCLUSIONS: CAB+RPV LA was highly acceptable, appropriate, and feasible for a large majority of staff across HIV care settings. Top rated perceived barriers at Baseline were patient ability to keep monthly appointments, transportation, and awareness of missed injection visits. At M4, a smaller proportion of staff reported these barriers, suggesting CAB+RPV LA implementation concerns notably decrease after an initial implementation phase.

LBPEE43

ADAPTING AND OVERCOMING TO THE CHALLENGES OF HIV PREVENTION AND TREATMENT ACTIVITIES UNDER THE THREAT OF SARS-COV-2 IN MYANMAR

N.N. Tun[1,2], M.M.M. Hlaing[3], F. Smithuis[4,5]
[1]Medical Action Myanmar, HIV and Research, Yangon, Myanmar, [2]Myanmar Oxford Clinical Research Unit, HIV and research, Yangon, Myanmar, [3]Medical Action Myanmar, HIV and research, Yangon, Myanmar, [4]Medical Action Myanmar, Director, Yangon, Myanmar, [5]Myanmar Oxford Clinical Research Unit, Director, Yangon, Myanmar

BACKGROUND: Myanmar is a resource-limited country in South-East-Asia with 54 million people. HIV is concentrated in key populations of people who inject drugs (PWID), men who have sex with men and female sex workers, with respective prevalence of 19.0%, 6.4%, and 5.6% while the general population is below 1%. The first COVID-19 case was confirmed on 23rd March. Although the number of confirmed cases remained low in Myanmar, it leads to an outbreak of fear and threatened routine health care services. Medical Action Myanmar is a non-profit medical organization working for primary health care integrated with HIV prevention and treatment services with support of PEPFAR and other donors. The total general clinic visits and the new HIV testing uptake dramatically reduced to 40% and 15% respectively of what we have achieved before. HIV patients experienced a surge of fear, stigma, and virus-shaming and avoided routine care. It is critical to explore the possible ways to maintain HIV care activities under pandemic.

DESCRIPTION: The clinic team is transformed into Covid-19 triage team, equipped with personal protection, continues HIV care especially for life threatening opportunistic infections while the stable patients are on multi-month ART dosing. The outreach prevention activities continue either with small team or individual visits. Many activities are adapted into e-communications including online platforms, one-to-one health education, individual condoms delivering, phone-based compliance monitoring. The trained community volunteers based the needle and syringe dispensing model helps PWIDs to get the continuous supply of sterile needles and syringes during pandemic.

LESSONS LEARNED: Consequently, the similar ART patients' consultations were maintained as in non-COVID-19 period (6,009 in April 2019 vs. 6,630 in April 2020). No additional ART drop-out cases were seen during the pandemic. For HIV prevention, 98% of the sterile needle and syringe supply (55,379 in January 2020 vs. 54,098 in April 2020) and 60% of condoms distribution achievement (49,354 in January 2020 vs. 29,612 in April 2020) were maintained in compare with the period before the pandemic.

CONCLUSIONS/NEXT STEPS: Our results highlighted that we can continue HIV prevention and treatment activities under the COVID-19 pandemic threat and should be copied in many other similar settings.

LBPEE44

RAPID ADAPTATION OF HIV DIFFERENTIATED SERVICE DELIVERY PROGRAM DESIGN IN RESPONSE TO COVID-19: RESULTS FROM 14 COUNTRIES IN SUB-SAHARAN AFRICA

P. Preko[1], S. Shongwe[2], A. Abebe[3], A.O. Vandy[4], D. Aly[5], F. Boraud[6], S. Caldwell[7], R.I. Chuy[8], C. Gwanzura[9], H.N. Kambale[10], J. Kiggundu[11], L. Momanyi[12], P. Mulenga[13], S. Ngoma[14], M. Phokojoe[15], M. Rutaihwa[16], M. Rabkin[1]
[1]ICAP at Columbia University, New York, United States, [2]ICAP at Columbia University, Mbabane, Eswatini, [3]Federal Ministry of Health, Addis Ababa, Ethiopia, [4]Ministry of Health, Freetown, Sierra Leone, [5]Ministry of Health, Maputo, Mozambique, [6]ICAP at Columbia, Abidjan, Cote D'Ivoire, [7]Ministry of Health, Monrovia, Liberia, [8]Ministry of Health, Kinshasa, Congo, Democratic Republic of the, [9]Ministry of Health, Harare, Zimbabwe, [10]Ministry of Health, Mbabane, Eswatini, [11]Ministry of Health, Kampala, Uganda, [12]Ministry of Health, Nairobi, Kenya, [13]Ministry of Health, Lusaka, Zambia, [14]Ministry of Health, Lilongwe, Malawi, [15]National Department of Health, Pretoria, South Africa, [16]Ministry of Health, Dar es Salaam, Tanzania, United Republic of

BACKGROUND: Countries around the world have launched less-intensive treatment models for people living with HIV (PLHIV) doing well on antiretroviral therapy (ART). These differentiated service delivery (DSD) approaches include both facility and community-based individual and group models. The HIV Coverage, Quality, and Impact Network (CQUIN) is a south-to-south learning network of 14 countries in sub-Saharan Africa (SSA) designed to foster the implementation of high quality DSD at scale. In April 2020, CQUIN conducted a rapid survey to understand the impact of the COVID-19 pandemic on DSD policy and implementation in the first weeks of the pandemic response.

DESCRIPTION: CQUIN supports a community of practice of National DSD Coordinators from each network country. These 14 experts, situated at Ministries of Health, communicate regularly, virtually and in person. On April 3, we circulated questions about changes to the national HIV-DSD program response. The Coordinators reviewed and confirmed the policy changes the week of April 13 and updated results the week of May 4.

LESSONS LEARNED: Within weeks of the first reports of COVID-19 in SSA, all 14 countries made substantive changes to their national DSD programs. Aiming to protect PLHIV and health care workers and enhance program resilience, the most common adaptation was the expansion of multi-month dispensing (MMD) to decrease health facility visit frequency. Ten countries expanded MMD eligibility, including four that waived requirements for HIV viral load suppression

for people on ART, six that newly permitted MMD for people initiating ART, and three that newly included pregnant/breast-feeding women and virally suppressed children above 2 years. Seven countries increased the amount of ART dispensed via MMD and nine enabled MMD of tuberculosis preventive treatment. Other changes included canceling or redesigning group models to enhance social distancing. Eight countries canceled > 1 model, including facility-based groups and Teen Clubs. Countries also expanded clinic hours, enhanced Fast Track service, and expanded community- and home-based drug delivery.

CONCLUSIONS/NEXT STEPS: COVID-19 spurred rapid changes in the design and delivery of HIV treatment amongst countries in the CQUIN network, which were able to leverage experience with less-intensive DSD models, MMD, and community-based treatment strategies to swiftly adapt their HIV treatment programs.

LBPEE45

DELIVERING PREP TO HOMELESS PEOPLE WHO USE DRUGS: INNOVATIONS IN LOW-THRESHOLD PREP PROGRAMMING

K. Biello[1,2,3], A. Bazzi[4], S. Vahey[5], M. Harris[5], L. Shaw[5], J. Brody[5,6]
[1]Brown University, Behavioral & Social Sciences and Epidemiology, Providence, United States, [2]Fenway Health, The Fenway Institute, Boston, United States, [3]Brown University, Center for Health Equity and Health Promotion, Providence, United States, [4]Boston University School of Public Health, Community Health Sciences, Boston, United States, [5]Boston Health Care for the Homeless Program, Boston, United States, [6]Harvard Medical School, Boston, United States

BACKGROUND: New HIV clusters are being identified among homeless people who use drugs (PWUD) in the U.S. Northeast and other regions. Antiretroviral pre-exposure prophylaxis (PrEP) is efficacious and recommended for HIV prevention in all at-risk populations; however, uptake remains low. Among numerous structural barriers to PrEP implementation is the widespread belief that homeless PWUD are not good candidates for PrEP.

DESCRIPTION: Boston Health Care for the Homeless Program (BHCHP) is a federally-qualified health center serving >10,000 individuals experiencing homelessness. On the front-lines of the statewide response to HIV transmission among PWUD, BHCHP implemented innovative "low threshold" services to increase PrEP uptake and retention, including intensive PrEP navigation to engage homeless PWUD, a dedicated PrEP nurse, same-day PrEP evaluations and prescribing without face-to-face physician consultations, short-term prescribing, and on-site medication storage. Descriptive statistics summarize linkage, prescription, and appointment data from electronic medical records in the first 18 months of this program.

LESSONS LEARNED: From 10/2018-2/2020, BHCHP linked 239 homeless PWUD to PrEP services. Median age was 37, 41% identified as female, nearly one-quarter were Latinx, 19% Black, and 7% had a primary language other than English. Nearly three-quarters had a history of injection drug use. Of 239 linked to PrEP services, 152 (64%) were prescribed PrEP, more than three-fold higher than the number of PrEP prescriptions (n=48) in the year prior to the roll-out of the low threshold PrEP program. Of those prescribed PrEP, 85% picked up their prescriptions. Among those prescribed PrEP, 67% were still on PrEP at 3 weeks, 40% at 3 months, and 25% at 6 months.

CONCLUSIONS/NEXT STEPS: PrEP linkage and retention rates in BHCHP's "low threshold" PrEP program are comparable to those documented among other populations, including among men who have sex with men attending sexual health clinics, a group for which PrEP has been targeted for nearly a decade. Innovative, culturally-competent strategies to engage and retain homeless PWUD can be successfully implemented in a community setting. These approaches should be considered in a range of service settings, possibly including syringe service programs and shelters, to increase PrEP access in at-risk homeless populations to avoid future outbreaks.

LBPEE46

IDENTIFYING HIGH RISK POPULATIONS FOR TARGETED TESTING AND RAPID TREATMENT RESPONSE FROM A COVID-19 SCREENING AND TESTING COHORT IN SOUTH AFRICA: AN OBSERVATIONAL DATA ANALYSIS

L. Stewart-Isherwood[1], P. Swanepoel[1], N. van der Merwe[1], M. Ncube[1], A. Krugel[1], I. Smart[1], W. Herbst[1], B. Mdlovu[2], T. Malone[3]
[1]BroadReach Group, Consulting, LLC, Cape Town, South Africa, [2]Provincial Department of Health, Mpumalanga, Mbombela, South Africa, [3]BroadReach Group, BroadReach HealthCare, Cape Town, South Africa

BACKGROUND: Globally, health systems have demonstrated limited testing and treatment capacity to manage critically ill patients in the current COVID-19 pandemic. Older people and people with uncontrolled pre-existing conditions are at high risk of adverse outcomes. Early identification of high-risk populations with targeted testing and rapid treatment response could contribute to curbing the burden on the health system. A cohort of data from Mpumalanga Province was analysed to observe the frequency of co-morbidity and age distribution during the national screening and testing campaign in South Africa.

DESCRIPTION: Community Healthcare Workers in the Mpumalanga Province of South Africa conducted community screenings to identify people with presumptive COVID-19 infection in the province. The screening tool used was designed to identify co-morbidities that included HIV, TB, COPD, obesity, cardiac disease, asthma, diabetes and hypertension. An analysis was then conducted to observe the co-morbidity frequency within the cohort of 549,662 screenings. Age and gender distribution were also analysed.

LESSONS LEARNED: We observed that the two most prevalent co-morbidities within the cohort were HIV and hypertension. However, comparing presumptive versus non-presumptive cases in each co-morbidity as a percentage; COPD and TB had the highest prevalence within presumptive cases. The age and gender distribution demonstrated that more females than males were screened and that the highest number of screenings were ranged from 5 and 14 years and 25 to 34 years. Most presumptive cases were aged 80 years and above amongst both males and females.

Co-morbidity	Presumptive	Non-presumptive	Ratio
COPD (Chronic obstructive pulmonary disease)	8.9%	2.0%	4.37
TB	8.0%	2.7%	2.91
Obesity	9.9%	3.8%	2.57
Cardiac disease	6.1%	3.3%	1.84
Asthma	9.4%	6.7%	1.39
Diabetes	10.8%	11.2%	0.97
HIV	25.8%	33.0%	0.78
Hypertension	21.1%	37.1%	0.57

[Table 1 – Co-morbidities reported for presumptive COVID-19 cases]

CONCLUSIONS/NEXT STEPS: A high prevalence of HIV and hypertension in people with suspected COVID-19 infection underscores the importance of continuously monitoring this population to ensure treatment adherence. However, the observational data further indicated that the highest risk populations remains with COPD, TB and elderly populations. This information can better inform Departments of Health to proactively activate targeted testing and treatment triage within their province.

LBPEE47

TELEHEALTH FOR THE CONTINUATION OF SAME-DAY ANTIRETROVIRAL THERAPY DURING THE COVID-19 OUTBREAK AND BEYOND

S. Amatavete[1], P. Seekaew[2], S. Lujintanon[1], T. Chinbunchorn[1], N. Teeratakulpisarn[1], S. Teeratakulpisarn[3], P. Jomja[3], C. Hanaree[1], C. Prabjunteuk[1], J. Sripanjakun[1], O. Nampaisan[1], J. Peelay[1], D. Lingjongrat[4], S. Janyam[5], P. Phanuphak[1], R. Ramautarsing[1], N. Phanuphak[1]
[1]Thai Red Cross AIDS Research Centre, PREVENTION, Bangkok, Thailand, [2]Columbia University Mailman School of Public Health, Department of Epidemiology, New York, United States, [3]Thai Red Cross AIDS Research Centre, Anonymous clinic, Bangkok, Thailand, [4]Rainbow Sky Association of Thailand, Bangkok, Thailand, [5]The Service Workers In Group Foundation, Bangkok, Thailand

BACKGROUND: During the COVID-19 pandemic, antiretroviral therapy (ART) initiation and maintenance practices have significantly adapted to resource constraints in overwhelmed public health systems. Travel restrictions and lockdown have affected access to ART facilities. Same-Day ART initiation (SDART) has been implemented at the Thai Red Cross Anonymous Clinic (TRCAC) in Bangkok since 2017. Telehealth was added to continue service delivery while maintaining social distancing during COVID-19. As part of the USAID/PEPFAR-funded LINKAGES project, we report feasibility and safety of telehealth to assist SDART follow-up at TRCAC.

METHODS: TRCAC continued SDART service during COVID-19. Telehealth with ART consultation and targeted physical examination conducted by doctors through LINE application video call was rapidly incorporated into follow-up visits the last week of March 2020. ART-naïve clients who agreed to SDART at TRCAC were clinically assessed. If eligible, clients received a four-week ART supply the same day as HIV diagnosis. Follow-up was scheduled two weeks thereafter using telehealth. Clients who tolerated ART well were referred to long-term ART facilities according to their health insurance scheme and another six-week ART supply was mailed to ensure ART continuation during the transition.

RESULTS: Sixty-nine clients (93.2% of those who accepted SDART) initiated SDART March 30–May 15, 2020. Median (IQR) time from HIV diagnosis to ART initiation was 1 (0–2) day. Of these, 68 (98.5%) accepted telehealth follow-up. Of 47 clients who reached the two-week follow-up, 37 (78.7%) used telehealth. Among the 10 (21.3%) who came for in-clinic follow-up, two had rashes, three needed syphilis injectable treatment, and five wanted face-to-face consultations. No one discontinued ART. Rashes were identified in four clients, and two (50%) were managed through telemedicine. Overall, follow-up visits were successfully conducted in 100% of 47 clients, compared to 97.2% of 105 clients from the same period last year.

CONCLUSIONS: Incorporating telehealth follow-up for SDART was highly acceptable and feasible in an HIV testing center in Bangkok. Telehealth is a safe and promising differentiated ART service delivery method, even for clients who just started on ART. Equity, economic, and sustainability aspects of SDART telehealth should be explored beyond its application during the COVID-19 pandemic.

LBPEE48

HEALTH CARE DISRUPTION AND MENTAL HEALTH AMONG PEOPLE LIVING WITH HIV DURING COVID LOCKDOWN IN ARGENTINA

J. Ballivian[1], M.L. Alcaide[2], D. Cecchini[1], D.L. Jones[3], J.M. Abbamonte[3], I. Cassetti[1]
[1]Helios Salud, Buenos Aires, Argentina, [2]University of Miami Miller School of Medicine, Dept of Medicine, Miami, United States, [3]University of Miami Miller School of Medicine, Dept of Psychiatry & Behavioral Sciences, Miami, United States

BACKGROUND: To mitigate the rapid spread of Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2), the coronavirus that is the causative agent of the Corona Virus Disease 2019 (COVID-19), enforced lockdown (quarantine) began in Argentina on March 20 with 158 confirmed cases. Lockdown is especially important for high-risk individuals such as older adults (>60 years) and persons with underlying medical conditions, including people living with HIV (PLWH). PLWH may be at higher risk for severe illness from COVID-19, and also for mental health complications. This cohort study examines the impact of COVID-related stress and enforced lockdown on mental health and treatment adherence among PLWH in Argentina.

METHODS: Participants were PLWH enrolled in a private/social security clinic network, the largest provider for HIV healthcare in Argentina. Participants completed an anonymous online survey assessing adherence to HIV treatment, COVID-19 prevention behavior, disruptions to resources, psychosocial factors, and substance use.

RESULTS: A total of 1336 participants (892 men and 444 women), aged between 18-82 years, residing mostly in Buenos Aires Metropolitan Area (94.1%) completed the online survey. Participants reported high adherence to lockdown (96.8%); difficulty in obtaining basic necessities such as food or clothing (41%) and 35% reported challenges in utilizing telehealth or internet-delivered medical services. Similarly, 10% reported disruption in obtaining non-HIV medication, and 4% reported HIV medication disruption; 33% reported suboptimal adherence. Discontinuation of mental health treatment was reported by 10%, though only 1% reported substance use treatment disruption. Mental health challenges were frequent: depression (16%), loneliness (18%), anxiety (20%), stress (35%) or irritability (10%). Abuse (sexual, emotional or physical) was reported by 7%.

CONCLUSIONS: High adherence to prevention measures was reported among PLHV. The impact of COVID-stress and enforced lockdown in Argentina on emotional health is apparent and may be impacting medication adherence. Challenges to provision of telehealth services, though more likely to be accessible to those with private insurance, were common. Results highlight the importance of providing support for health care services that can reach all PLWH during lockdown, to promote health and adherence to treatment and to empower PLWH with strategies to cope with stress and adversity during the pandemic and beyond.

LBPEE49

VULNERABILITY, TRAUMA AND RESILIENCY IN THE FACE OF CORONAVIRUS ADVERSITY: PRELIMINARY RESULTS AMONG A COHORT OF PEOPLE LIVING WITH HIV IN ONTARIO, CANADA

M.A. Kesler[1], W.J. Oakes[1], K. O'Brien[1], D.J. Brennan[2], F. Ibanez-Carrasco[3], A. Betts[4], W. Tharao[5], A.N. Burchell[6,7], A.E. Kroch[1,8,9]
[1]Ontario HIV Treatment Network, Data and Applied Science Impact, Toronto, Canada, [2]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [3]St. Michael's Hospital, Centre for Urban Health Solutions, Toronto, Canada, [4]AIDS Committee of Durham Region, Oshawa, Canada, [5]Women's Health in Women's Hands Community Health Centre, Toronto, Canada, [6]St. Michael's Hospital, Unity Health Toronto, Toronto, Canada, [7]University of Toronto, Toronto, Canada, [8]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [9]Public Health Ontario, Toronto, Canada

BACKGROUND: Resilience, or positive adaptation to challenging situations, has potential to improve health outcomes for people living with HIV (PLWH), particularly during periods of crisis. The objective of this study was to assess the psychosocial impact of the coronavirus crisis on PLWH's resiliency beliefs and behaviours.
METHODS: The Ontario HIV Treatment Network Cohort Study (OCS) is a community-driven longitudinal, clinic-based cohort of over 9000 PLWH who have received care in Ontario, Canada. On March 17, 2020, the province declared a public health crisis and introduced physical distancing measures to minimize the spread of COVID-19. On April 30, 2020, a new 35-item COVID-19-specific module was added to the interviewer-administered questionnaire. Interviews were conducted virtually. Experiences of self-isolation, perceptions of vulnerability, trauma and resiliency beliefs and behaviours are described.
RESULTS: Preliminary results are included for 52 responses collected by May 22, 2020, including 25 women and 27 men (median age: 51 years), 56% White, 42% Black and 48% identified as gay/lesbian/bisexual/queer. 85% reported self-isolation (stayed home all/nearly/most of the time). A majority felt that HIV made them more vulnerable to COVID-19: 57% believed that PLWH had increased chances of catching COVID-19, and 79% believed PLWH were more likely to get seriously ill with COVID-19. Some believed that PLWH are more likely to be denied a ventilator (29%) and that PLWH would not receive equivalent care (13%). Participants exhibited high levels of traumatic recurring thoughts (at least once a week) about the loss of family/friends (58%), past experiences of isolation (31%), dying (31%), people lost due to HIV/AIDS (28%) and/or flashbacks of the AIDS crisis (23%). Conversely, participants exhibited resiliency beliefs and behaviours including, employed creative ways to alter difficult situations (73%), controlled their reactions (92%) and believed they could grow in positive ways by dealing with difficult situations (85%).
CONCLUSIONS: Despite PLWH feeling more vulnerable, perceiving stigma in healthcare if they were to acquire SARS-CoV-2, and experiencing traumatic recurring thoughts, they exhibited strong resiliency beliefs and behaviours. During this period of crisis, resiliency has the potential to be a powerful resource in fostering positive adaption among PLWH and could be essential for effective psychosocial interventions.

LBPEE50

ENSURING ACCESS TO SOCIAL PROTECTION BENEFITS FOR KEY POPULATIONS (KPS) AND PEOPLE LIVING WITH HIV (PLHIV) BY NATIONAL AIDS CONTROL ORGANISATION (NACO) UNDER THE COVID-19 SITUATION

U. Das[1], D.N. Goel[1], D.R.K. Rana[1], G. Sharma[2], V.B. Franklin[1]
[1]National AIDS Control Organisation, NEW DELHI, India, [2]UNDP, New Delhi, India

BACKGROUND: India is estimated to have 2.2 million PLHIV and the national programme is covering over 1.2 million key population (KP) belonging to MSM, FSW, IDU, Hijra/TG community. The recent COVID-19 pandemic has impacted the lives of KPs and PLHIV in terms of livelihood, nutrition and access to services. It was important for NACO to respond to this pandemic situation and ensure Social Protection (SP) benefits to KPs and PLHIV to mitigate the impact of COVID 19.
DESCRIPTION: NACO acted swiftly by engaging key ministries, development partners, community and Civil Society Organizations to ensure access of SP benefits to KPs and PLHIV. NACO organized a national level virtual consultation involving key stakeholders to work out strategies and based on the outcomes of the consultation, the following process was adopted: 1) Key ministries with whom NACO has signed MoU were mobilized for providing SP benefits to KPs and PLHIVs, 2) States were geared up through letters received from NACO to map the population and reach out to beneficiaries, 3) SoP was issued to States to scale up efforts for providing SP benefits, 4) responsibilities were given to partners and mobilize their resources, 5) Communication materials on COVID 19 and HIV were developed and shared with States; 6) Hand-holding of States through virtual meetings and 7) Information through Helpline.
LESSONS LEARNED: 18 key ministries were mobilized to extend SP benefits to KPs and PLHIV. All 37 States/UTs mobilized the line departments for extending support for PLHIV and KPs. More than 0.2 million KPs and PLHIV were provided with minimum package of SP benefits namely nutrition, pension and medical services apart from grocery, sanitizers and masks. Financial assistance was also released to over 20,000 beneficiaries and special permissions were obtained for home delivery of ARV drugs to PLHIV.
CONCLUSIONS/NEXT STEPS: Providing the KPs and PLHIV with SP benefits is not a responsibility of one department but is a collective response of various departments. In this pandemic situation, it is crucial to work closely with the departments, partners, community, private sector and NGOs to provide social security benefits to KPs and PLHIV and build capacity of the community for resilience.

LBPEE51

ESTIMATED COSTS OF COMMUNITY-BASED ANTIRETROVIRAL THERAPY DELIVERY AMIDST COVID-19 LOCKDOWN IN MID-WESTERN UGANDA

R. Ssebunya[1], P. Elyanu[2], H. Sekabira[3], P. Nahirya-Ntege[2], H. Haq[4], A. Kekitiinwa[1]
[1]Baylor College of Medicine Children Foundation, Uganda, Research & Programs, Kampala, Uganda, [2]Baylor College of Medicine Children's Foundation, Uganda, Research, Kampala, Uganda, [3]Baylor College of Medicine Children's Foundation, Uganda, Medical & Pyschosocial, Kampala, Uganda, [4]Baylor College of Medicine, Houston, Texas, Texas, United States

BACKGROUND: People living with HIV/AIDS (PLHA) in Uganda have had challenges accessing antiretroviral therapy (ART) following a national lockdown to mitigate COVID-19. In response to these chal-

lenges, Baylor College of Medicine Children's Foundation-Uganda (Baylor-Uganda) implemented a community-based ART delivery (CBAD) strategy to sustain continuity of ART for PLHA in mid-western Uganda. Before the lockdown, PLHA used public transport at their own cost to come to health facilities. We estimated additional costs to Baylor-Uganda in supporting this approach amidst the lockdown.

METHODS: To sustain the new CBAD strategy in which health workers deliver ART to homes of clients missing clinic appointments, Baylor-Uganda incurs additional costs including staff transport and allowance, motorcycle repairs, purchase of delivery envelopes, airtime. Based on financial records for the period 9th - 26th April 2020, we computed the unit cost to deliver ART to one client by dividing total direct cost by number of clients who received HIV medicines at home. We estimated the regional cost of delivering ART by multiplying unit cost (USD) by total patients who will miss their appointments within 1st April - 30th May 2020.

RESULTS: Between 9th and 26th April 2020, $1,638 were spent on staff transport, allowance, airtime, motorcycle repairs and envelopes to reach 586 clients who had missed their clinic appointment in Kasese district. This is equivalent to a unit cost of $2.80 per patient delivered ART. With an estimated 15,000 clients scheduled between 1st April and 30th May 2020 and 27% of clients currently missing their appointments, we estimated a total $11,319 would be required to sustain the CBAD initiative for two months in the nine districts of Rwenzori region (table1). A total of $33,957 would be needed if CBAD strategy continues for the next 6 months and $28,861 factoring in a 15% proportion receiving multi-month refills. An estimated 3,395 new HIV positive clients would have been identified using the same $28,861 under assisted partner notification modality ($8.5).

Staff transport, allowance & Airtime	Envelopes	# clients delivered ART	Unit cost	Clients to miss appointments (1st April - 30th May 2020)	Total cost (UGX)	Total cost in 2 months (USD)	Total cost in next 6 months (USD)
5989036	234400	586	10620	4050	43,011,801	11319	33957

CONCLUSIONS: HIV service providers will require extra planning and budgetary support in order to maintain continuity ART for PHLA during epidemics and other emergencies.

LBPEE52

ASSESSING THE PREVALENCE OF DEPRESSIVE SYMPTOMS AMONG PREP USERS DURING THE COVID-19 OUTBREAK IN MEXICO. A LATENT CLASS ANALYSIS

D. Cerecero[1], H. Vermandere[1], J. Gómez-Castro[1], J.A. Sánchez-Ochoa[2], A. Martínez-Dávalos[1], I. Huerta-Icelo[1], I. Bojorquez[3], S. Bautista-Arredondo[1]
[1]National Institute of Public Health, Cuernavaca, Mexico, [2]University of Guadalajara, Guadalajara, Mexico, [3]El Colegio de la Frontera Norte, Tijuana, Mexico

BACKGROUND: Recent reports alert about increasing levels of depression and other mental health problems resulting from the COVID-19 pandemic. However, the impact of the COVID-19 outbreak on the mental health of populations at high risk for HIV has not been documented. We assess the prevalence of depressive symptoms (DS) among Mexican men who have sex with men (MSM) and explore the association with consequences of the COVID-19 pandemic.

METHODS: We conducted an online survey among 595 MSM assessing DS using the Center for Epidemiological Studies Depression Scale (CESD-10). We compared the results to previously self-reported DS among the same population and to national data. We applied latent class analysis (LCA) to identify groups with similar burdens resulting from the COVID-19 pandemic and their association with DS using logistic and quantile regression models.

RESULTS: The prevalence of significant DS was 53%; six-fold higher than DS reported before the outbreak (8.6%). Younger participants, those without social support and with high risk of acquiring COVID-19 reported higher DS. By LCA posterior probabilities we identified three classes: (1) minimally impacted by COVID-19 (54% of the population), (2) objective risk factors for COVID-19 (41%), and anxiety and economic stress caused by COVID-19 (5%). The prevalence of DS was 45%, 60%, and 80% for class one, two, and three respectively. Compared to those in class one, the odds to have significant DS increased with factor 5 for those in class three (OR 5.0, 95% CI 1.8-14.1). Among the most depressed, COVID-19 related variables were not associated with their CESD-10-score.

CONCLUSIONS: To our knowledge, this is the first study to assess the relationship between DS COVID-19 consequences among MSM. Our findings suggest high levels of depression among PrEP users in Mexico during the COVID-19 pandemic associated with the objective perception of risk for COVID-19 infection and with economic stress caused by the preventive measures adopted in Mexico. Given the characteristics of this population our results also highlight the need for targeted psychological interventions.

LBPEE53

COVID-19 PANDEMIC INCREASES SOCIOECONOMIC VULNERABILITY OF LGBTI+ COMMUNITIES AND THEIR SUSCEPTIBILITY TO HIV

E. Lamontagne[1,2], T. Doan[3], S. Howell[4], A. Yakusik[1], S. Baral[5], S. Strömdahl[6], G.-M. Santos[7,8], B. Ackerman[9], S. Wallach[5], C. Beyrer[5], S. Arreola[10], I. Holloway[11], V. Silenzio[12], L. Yu[13], T. Noori[14], A. Rao[5], G. Ayala[10], A. Garner[4], C. Strong[15], T. Adamson[5], P. Huang[16], D. Cerasuolo[17], A. Bishop[18], A. Pharris[14], M. Aung[3], M. Dara[19], S.Y. Chung[20], M. Hanley[21], C. Cortes[22], P. Crehan[23]

BACKGROUND: The COVID-19 pandemic and its public health response are causing an historical crisis that has exacerbated prevailing inequalities. It may worsen economic circumstances of LGBTI+ people, which might increase their exposure to HIV. This study's purpose is to estimate the effect of COVID-19 on economic vulnerabilities among LGBTI+ globally and their subsequent susceptibility to HIV infection.

METHODS: We conducted a cross-sectional online survey from 16/04 to 18/05/2020, combining established instruments with questions related to COVID-19. LGBTI+ community members were involved in each step of the survey development. The survey covers access to HIV services, employment, economic vulnerability, behavioural economics, health, sex work and drug use. The questionnaire was available in 10 languages and broadcasted online among LGBTI+ social networks.

RESULTS: We collected responses from a convenience sample of 13,562 LGBTI+ participants from 138 countries/territories. About 91% of respondents were partly or entirely confined, leading to impacts on their economic situation. For example, among participants living with HIV (n=1,140), a quarter (26%) have experienced interrupted or restricted access to refills of ART medication. Out of this group, over half (55%) have a month's stock supply or less or ART available.

Half (47%) of those currently working (n=9,478) are expecting to lose their employment in the wake of the COVID-19 crisis and 12.6% already lost it. This has immediate consequences for 45% of the respondents facing economic difficulty; 73% could not meet their basic needs; 37% had to skip meals or reduce meal sizes. The crisis pushed 1% of the respondents to start engaging into sex work. Among those engaged in sex work (n=1,532), the economic situation induced by COVID-19 has reduced their capacity to negotiate safe sex practices, resulting in more condomless relations (3%), or taking more risks (7%), increasing their exposure to HIV. Finally, the COVID-19 crisis reduced access to safe injection equipment for 36% of those injecting drugs (n=224). It also limited the access to opioid substitution therapy for 26% of those who need it.

CONCLUSIONS: The COVID-19 and its responses has increased the socioeconomic vulnerability among the LGBTI+ community, threatened their health and increased their susceptibility to HIV infection.

LESSONS LEARNT ON THE FRONTLINE: IMPACT OF COVID-19 ON LGBT COMMUNITIES AND COMMUNITY-LED RESPONSE MECHANISMS IN AFRICA AND THE CARIBBEAN

R. Simister[1], V. Chikalogwe[2], R. Lutwama[3], C. Paris[4], L. Matthyse[5]
[1]Frontline AIDS, Hove, United Kingdom, [2]People Against Suffering, Oppression and Poverty, Cape Town, South Africa, [3]Community Empowerment and Self-Support Organization, Nairobi, Kenya, [4]Refugee Coalition of East Africa, Nairobi, Kenya, [5]Gender Dynamix, Cape Town, South Africa

BACKGROUND: The Frontline AIDS Rapid Response Fund provides LGBT people across Africa and the Caribbean with small grants to continue accessing HIV services and address human rights barriers in emergency situations. The Fund has managed a threefold increase in application numbers since the outbreak of COVID-19.

DESCRIPTION: 35% of all grants have addressed housing and related livelihood needs, highlighting that precarious living situations exacerbate LGBT people's vulnerability to HIV and limit access to effective treatment. Analysis of 300 applications since March 2020 and rapid research with grantees in April 2020, evidences how COVID-19 has further restricted social and economic rights for LGBT people, many of whom are migrants and sex workers. Loss of income; exclusion from social protection schemes; exclusion from national COVID-19 responses; interruption of HIV services, have increased LGBT communities' vulnerability to COVID-19, interruptions of ART and hormone therapy, and exposure to targeted human rights abuses.

LESSONS LEARNED: Resilient community-led responses have proven vital for supporting LGBT people vis-a-vis COVID-19. Mechanisms include, firstly, knowledge of human rights apparatuses and the ability to utilize them; and, secondly, adaptability of services to new challenges. Adaptations have included home delivery of medication; remote adherence groups; cash transfers; food supplements; and rent support. Supporting LGBT organisations' functionality has proven an importance outcome for maintaining trust with clients in environments hostile to LGBT rights. Strong political leadership and resources are required to sustain the resilience of community-led responses for the COVID-19 outbreak and aftermath.

CONCLUSIONS/NEXT STEPS: Rapid responses and prioritising the socio-economic determinants of health are key for effectively supporting LGBT communities within COVID-19 responses in Africa and the Caribbean. Community-led response mechanisms working collaboratively with the governments and donors are best placed to address the needs of LGBT people. This analysis informs decision-making among national governments and donors about key priorities and effective methods for mitigating the negative impact of COVID-19 on LGBT communities. The analysis evidences the need for health planners and donors to address the social and economic rights of LGBT people as a key determinant of health outcomes-both in relation to COVID-19 and HIV.

LBPEF55

CALL FOR LIFE; SUPPORTING PEOPLE LIVING WITH HIV (PLHIV) WITH AN INTERACTIVE VOICE RESPONSE TOOL DURING THE COVID-19 LOCKDOWN IN UGANDA

E. Oseku[1], E. Nakibuuka[1], J. Mutala[1], L. Namyenya[1], M. Nanyonjo[1], A.N. Kabuye[2], M.S. Nabaggala[2], N. Owarwo[2], A.B. Naggirinya[2], F. Musinguzi[2], R. Obaikol[2], R. Parkes-Ratanshi[2]
[1]Infectious Diseases Institute, Kampala, Uganda, [2]Infectious Diseases Insitute, Kampala, Uganda

BACKGROUND: During the COVID-19 outbreak, Uganda's government issued a "lockdown" preventing all public (22nd March 2020) and private transport (28th March 2020), causing challenges for PLHIV and health care workers. We have been using Call for Life (CFL), web-based mHealth Interactive Voice Response tool, since December 2016 to support ART adherence. We present an evaluation of lockdown and COVID-19 related issues reported through CFL.

METHODS: CFL sends weekly automated calls to registered PLHIV attending three health facilities in 3 languages. CFL records self-reported ART adherence, and gives health information. PLHIV can report symptoms/concerns; CFL nurses receive alerts and phone PLHIV to give telephone advice. Alerts generated, concerns raised and responses to patients were analysed. Health facility patient records were used for demographics. Descriptive statistics used frequency and percentages for categorical variables and median and interquartile range for continuous variables.

RESULTS: Between 31.3.2020-11.05.2020, CFL initiated 38,588 calls, with 12,628 (32.7%) completed successfully, to 3421 PLHIV. 478 alerts from 367 PLHIV were generated, 329 (68.8%) from females among 566 patients. 382 alerts (79.9%) were true alerts, while 96 (21.1%) were unverified for reasons such as failure to contact the patient and mistaken reporting. 566 symptoms/concerns (some alerts produced

more than one concern) were reported (Table 1). 143 were COVID lockdown related; 126 concerned access to ART, 5 had food insecurity and 12 were concerned about access to medical care for other conditions. Two PLHIV had direct COVID related queries.

CATEGORY OF ALERTS	SYMPTOMS/CONCERNS REPORTED IN ALERTS	Infectious Diseases Institute Frequency	Kasangati Frequency	Kisenyi Frequency	Total Frequency	%
HIV related	ART drug related	4	2	5	11	1.9
	Non ART drug related	7	2	1	10	1.7
General Medical complaints	Respiratory symptoms	32	15	3	50	8.3
	Symptoms of febrile illness	25	73	4	102	18.0
	Other symptoms	151	78	19	248	43.8
COVID-19 related alerts	Anxiety/request for information	0	0	2	2	0.1
Lockdown related alerts	Guidance on access to general health care	11	1	0	12	2.14
	Food insecurity	4	1	0	5	0.8
	Inquiry on ART refills and access	92	14	20	126	22.3

[Table 1: Showing frequency and symptoms/concerns of alerts.]

CONCLUSIONS: During lockdown, CFL has provided key support to PLHIV through connection to nurses who provided information on ways of accessing ART such as alternative facilities. Simple phone based adherence tools can support continuity of HIV care during the oubreak, by allowing triage of PLHIV concerns. Lessons from COVID-19 can support differentiated care once the pandemic is controlled.

LBPEF56

COSTS SAVINGS TO PATIENTS WHO RECEIVED ANTIRETROVIRAL THERAPY DELIVERED AT HOME BY COMMUNITY ART MANAGEMENT (CAM) TEAMS DURING THE COVID-19 PANDEMIC IN CROSS RIVER STATE NIGERIA: A CROSS-SECTIONAL STUDY

E. Anugha-Ugochukwu[1], K. Obase[2], I. Abah[1], A. Ndep[1], C. Obi[3], P. Agada[4], N. Igwe[5], T. Badru[6], S. Ekponimo[6], P. Imohi[6], F. Eyam[7], C. Obiora-Okafo[8], O. Sanwo[7], H. Khamofu[7], S.R. Pandey[7], M. Bateganya[7], I. Iyotim[9], E. James[9]
[1]Achieving Health Nigeria Initiative (AHNi), Comprehensive HIV/TB Services, Calabar, Nigeria, [2]Achieving Health Nigeria Initiative (AHNi), Comprehensive HIV/TB Services, Calabar, Niger, [3]Achieving Health Nigeria Initiative (AHNi), Monitoring and Evaluation, Calabar, Nigeria, [4]Howard University Global Initiative Nigeria (HUGIN), Pharmacy Services, Calabar, Nigeria, [5]Achieving Health Nigeria Initiative (AHNi), Programs, Calabar, Nigeria, [6]Achieving Health Nigeria Initiative (AHNi), Prevention Care and Treatment, Abuja, Nigeria, [7]FHI 360 (Family Health International), Nigeria, Prevention Care and Treatment, Calabar, Nigeria, [8]FHI 360 (Family Health International), Nigeria, Monitoring and Evaluation, Abuja, Nigeria, [9]United States Agency for International Development (USAID), Prevention Care and Treatment, Abuja, Nigeria

BACKGROUND: The SARS-COV-2 (COVID- 19) pandemic has exposed weaknesses in the health and economic systems of almost all countries. Nigeria with a weak health infrastructure and high poverty rates could be more vulnerable to the impact of the pandemic. The USAID funded Strengthening Integrated Delivery of HIV/AIDS Services (SIDHAS) project adopted the CAM initiative which extends HIV services into the community. The purpose of this study was to assess the CAM approach as a cost-saving model for alleviating the economic impact of COVID-19 for clients on antiretroviral therapy (ART) in Cross River State.

METHODS: CAM teams (composed of medical doctors, pharmacists, medical laboratory scientists, partner notification officers, data entry clerks, case identification experts and case managers) provided home-based ART and COVID-19 awareness information to patients amidst movement restrictions in the state. We estimated cost savings to patients in terms of transportation costs to health facilities and accounted for COVID-19-related escalations in transportation fare by multiplying pre-COVID 19 fare rates by a factor of 1.5 for all categories.

RESULTS: A total of 1461 HIV patients were provided with ART refills, screened for; TB, gender-based violence (GBV), hypertension and diabetes. They were provided with information on COVID-19 and preventive measures. Of the 1461, 999 (68.4%) were female, 1249 (85.5%) were served in rural but accessible areas while 216 (17.9%) were served in hard-to-reach areas. Furthermore, 417 (77.7%) of the 537 clients eligible for viral load assessment had their blood samples taken. The total estimated economic cost for transportation was $170.36-$8,305.85), comprising 151(10.3%) at $0.26 – $1.28 cost, 245(16.8%) at $1.28 - $2.56 cost, 574 (39.3%) at $2.56 - $5.13 cost, 367(25.1%) at $5.13 - $12.82 cost, 84(5.7%) at $12.82 - $25.64 cost and 40 (2.7%) persons at >$25.64 cost.

CONCLUSIONS: Patients who received antiretroviral therapy at home had substantial cost savings. Those savings could be used to address other livelihood needs, particularly for rural dwellers. While these costs come at the expense of the program, CAM teams ensured refills, provided adherence support and delivered COVID-19 related information.

LBPEF57

ADVANCING ETHICAL HIV/CO-INFECTIONS RESEARCH IN PREGNANCY: GUIDANCE FROM THE PHASES WORKING GROUP

M. Little[1], M. Wickremsinhe[1], K. Sullivan[2], E. Jaffe[2], R. Faden[3], A.D. Lyerly[2], for the PHASES Working Group
[1]Georgetown University, The Kennedy Institute of Ethics, Washington, DC, United States, [2]University of North Carolina at Chapel Hill, Center for Bioethics and Department of Social Medicine, Chapel Hill, United States, [3]Johns Hopkins University, Berman Institute of Bioethics, Baltimore, United States

BACKGROUND: Numerous barriers to the inclusion of pregnant women in biomedical research have resulted in profound evidence gaps about how to safely and effectively treat and prevent HIV and co-infections during pregnancy and ethically address new threats to their health. Pregnant women deserve a robust and timely evidence base to better protect them and their offspring from undue risks and ensure timely access to new medicines. Yet a complex set of challenges - regulatory, oversight, and funding patterns, and confusion about ethical principles that should frame such research - have made adequate progress difficult.

DESCRIPTION: To address this pressing need and advance responsible research with pregnant women, the Pregnancy and HIV/AIDS Seeking Equitable Study (PHASES) Working Group – an international and interdisciplinary group from across the HIV research and advocacy community – has worked since 2017 to develop and finalize ethics Guidance. Recommendations are directed to multiple stakeholders and aim to secure better, earlier, and more systematic evidence on safely and effectively treating and preventing HIV and co-infections during pregnancy.

LESSONS LEARNED: These 12 final recommendations aim to decrease the likelihood that drugs used in pregnancy carry undue risks; to increase pregnant women's timely access to needed drugs; and to advance equitable representation of pregnant women's own health outcomes in studies: 1) affirm the need for research with pregnant women; 2) formalize a global network for advocacy and resources;

3) enhance training; 4) design for inclusion; 5) review for inclusion; 6) ensure equitable attention to pregnant women's own health; 7) integrate PK studies; 8) enhance post-approval safety assessments; 9) address legacy evidence gaps; 10) respect and support women's decisional authority; 11) ensure fair access to life-saving experimental drugs, and 12) contextualize risk findings.

CONCLUSIONS/NEXT STEPS: The global HIV research community has long been an exemplar of finding pathways to address complex and underserved communities, and has demonstrated that ethical and impactful research with pregnant women *is* possible. As we continue to work together to end HIV and co-infections and face emergent pathogens, adoption of these recommendations will critically advance equitable attention to a centrally affected population, pregnant women and the children they bear.

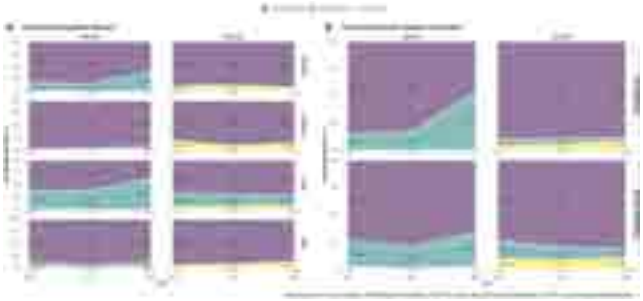
THE AFFORDABLE CARE ACT AND HIV PRE-EXPOSURE PROPHYLAXIS: REGIONAL DISPARITIES IN QUALIFIED HEALTH PLAN COVERAGE AND PRIOR AUTHORIZATION REQUIREMENTS, 2018-2020

K. McManus[1], S. Powers[1], A. Killelea[2], E. Rogawski McQuade[3]
[1]University of Virginia, Infectious Diseases and International Health, Charlottesville, United States, [2]NASTAD, Health Systems and Policy, Washington DC, United States, [3]University of Virginia, Public Health Sciences, Charlottesville, United States

BACKGROUND: In October 2019, tenofovir alafenamide/emtricitabine (TAF/FTC) joined tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) as an approved formulation for HIV Pre-exposure Prophylaxis (PrEP). PrEP is a key component of the Ending the HIV Epidemic (ETE) Initiative to curb new HIV diagnoses. We aimed to assess if there were differences in Qualified Health Plans' (QHPs) coverage and prior authorization (PA) requirements.

METHODS: Using chi-square tests, we compared coverage and PA requirements for TDF/FTC and TAF/FTC by region and ETE Phase 1 jurisdiction status among all QHPs offered in the Affordable Care Act Marketplace for 2018-2020.

RESULTS: QHPs (2018: n=19444, 2019: n=17003, 2020: n=20650) covered TDF/FTC at a higher rate than TAF/FTC (99.0% vs 92.4%, 100.0% vs. 92.8%, 98.9% vs. 91.2%, in 2018-2020, respectively, p<0.001). Southern and Midwestern QHPs required PA for TDF/FTC at higher rates for 2018-2020; from 2019 to 2020, the rates of PA for TDF/FTC approximately doubled in the South and Midwest (Figure 1A, p<0.001). Northeastern and Western QHPs had lower coverage of TAF/FTC, and Southern QHPs required PA for TAF/FTC at the highest rates for 2018-2020 (p<0.001). Coverage of TDF/FTC and TAF/FTC were higher in ETE jurisdictions (Figure 1B, p<0.001). PA for TDF/FTC was higher in ETE jurisdictions whereas PA for TAF/FTC was lower (p<0.001).



[Figure 1. Coverage and prior authorization requirements for TDF/FTC and TAF/FTC with affordable care act qualified health plans 2018-2019]

CONCLUSIONS: Despite both including indications for treatment and biomedical prevention in 2020, there are differences in coverage and PA between the two formulations in 2020. The differences could reflect differences in clinical indication or manufacturer discounted pricing; or anticipation of changing regulatory environment and emerging generic options. It is concerning to find high rates of PA for TDF/FTC in areas of the United States where HIV transmission occurs more frequently (South and ETE jurisdictions). The South already lags behind other regions for PrEP uptake. Regional disparities in PrEP PA may result in differential uptake and impede the ETE Initiative.

LBPEF59

CRIMINALIZATION OF CONSENSUAL SEX BETWEEN MEN ASSOCIATED WITH POOR ACCESS TO HIV-SERVICES FOR GAY, BISEXUAL AND OTHER MEN WHO HAVE SEX WITH MEN WORLDWIDE: FINDINGS FROM GMHR 2019-2020

S. Arreola[1,2], D. Solares[3], J. Tohme[4], G. Ayala[5]
[1]MPact Global, Research, Oakland, United States, [2]Arreola Research, Research, San Francisco, United States, [3]Consultant for MPact Global, Research, Hong Kong, Hong Kong, SAR of China, [4]MPact Global, Policy, Oakland, United States, [5]MPact Global, Oakland, United States

BACKGROUND: Gay, bisexual men, and other men who have sex with men (GBMSM) are disproportionately impacted by HIV worldwide. Previous research has documented associations between sexual stigma (homophobia), health provider discrimination and poor access to health services. Less is known about the impacts of criminalization of consensual sex between men on access to HIV services.

METHODS: Using data from the Global Men's Health and Rights Study (n=1,825 from criminalizing & 4,361 from non-criminalizing countries), we conducted bivariate and multivariate analyses to compare GBMSM from criminalizing and non-criminalizing countries (drawing from ILGA World's 2019 State-Sponsored Homophobia report). We used chi-square test or Fisher's exact test to test bivariate differences in structural violence, community engagement, and HIV-service access. Multivariate analysis was conducted using variables that had a p<0.05 significance in bivariate analysis.

RESULTS: Globally, GBMSM had poor access to most HIV and other health services (Table 1). Compared to GBMSM from non-criminalizing countries, those from criminalizing countries were significantly more likely to be: younger, members of racial/ethnic minority groups, unemployed, sex-workers, unaware of their HIV-status; unable to financially meet needs, and uninsured. In addition, GBMSM in criminalizing countries were more likely to report provider-stigma and to have poor access to HIV-prevention, PrEP, HIV-Care and HIV-ART. Conversely, they were significantly less likely to have post-secondary education or community engagement (Table 2). Multivariable analysis revealed that GBMSM from criminalizing countries had higher odds of being under age 30, sex-workers and having unknown HIV-status; were more likely to report not having enough money to meet their needs; and more likely to report poor access to HIV-prevention, PrEP, and HIV-Care (Table 3).

CONCLUSIONS: Criminalization worsens access to HIV services and creates financial instability for GBMSM. As recommended by WHO, comprehensive HIV responses, inclusive of decriminalization and structural-level interventions, are essential to address the specific needs of GBMSM.

[Table 1: Overall access to health services]

HOME-BASED ARV DELIVERY DURING COVID-19: FROM POLICY TO PRACTICE IN JAKARTA, INDONESIA

A.G. Haryawan[1], I. Romyco[1], A. Human[1], L. Umboh[1], B. Taruno[1], R.A. Pramono[2], A. Aribowo[1], E.R. Aditya[1], C. Francis[1]
[1]FHI360/LINKAGES Indonesia, Jakarta, Indonesia, [2]Jakarta Provincial Health Office, Jakarta, Indonesia

BACKGROUND: Providing home delivery of antiretroviral medications is a promising option to ensure safe and sustained access to lifesaving HIV treatment among people living with HIV (PLHIV) where COVID-19-related lockdowns, quarantines, and physical distancing restrictions may impose substantial barriers to treatment retention. In Jakarta, Indonesia, the Provincial Health Office (PHO) incorporated home-delivery into official policy and is working with the USAID and PEPFAR-supported LINKAGES project to scale the practice through the Jak-Anter home-based ARV delivery system.

DESCRIPTION: In March 2020, the PHO introduced home-based ARV delivery into emergency regulations, setting in motion parameters for differentiated service delivery options. Social distancing measures limited the ability for community-based HIV service personnel to deliver ARVs to PLHIV, and the LINKAGES project was mobilized to create the Jak-Anter home-based ARV delivery system which utilizes ride-based apps and transport courier services to expedite implementation. Site-level performance incentives have also been introduced to quickly move the policy into practice. As of May 4, 2020, more than 1,300 PLHIV at 45 facilities in Jakarta were able to maintain access to HIV treatment through home delivery – 9% of all eligible PLHIV in 60 highest burden HIV treatment facilities.

LESSONS LEARNED: Advocacy emphasizing the safeguarding benefits of home delivery for both PLHIV beneficiaries and providers under COVID-19 was instrumental in securing implementation support. In Jakarta, Indonesia, branding and promotion, as well as site-based performance incentives for patient retention, is helping support rapid adoption.

CONCLUSIONS/NEXT STEPS: Jak-Anter is now being scaled across all HIV treatment facilities in Jakarta, and the surrounding metropolitan area, potentially serving up to 30,000 PLHIV in the coming months.

LBPEF61

BIOPOLITICS AND GOVERNMENTALITY IN THE AGE OF COVID-19: BIOLOGICAL CITIZENSHIP (OR LACK THEREOF) OF KEY POPULATIONS IN THE RESPONSE AGAINST HIV, HEPC & OTHER STIS DURING A NATIONAL LOCKDOWN

G. Rostom[1,2,3], H. Castañeda[3], N. Khodabocus[1,2], N. Ritter[1,2], D. Rojas Castro[2]
[1]PILS - Prévention, Information et Lutte contre le Sida, Port-Louis, Mauritius, [2]Coalition Internationale Sida, PLUS, Direction Recherche Communautaire, Pantin, France, [3]University of South Florida, Department of Anthropology, Tampa, United States

BACKGROUND: Until now, 334 cases of COVID-19 have been detected in Mauritius with 10 fatalities. The enforcement of a national lockdown – which included closing the border, enforcing curfews, and closing all non-essential activities until 2nd June 2020 is among the many public health measures undertaken to contain the current epidemic. Left out of consideration and without dedicated resources to weather the lockdown are key populations (KP) living with HIV, Hep C, and other STIs. Biological citizenship allows to understand the exclusions faced by KPs these populations and their experiences of disproportionate hardships during the pandemic.

METHODS: The present work is based on 1) over 120 hours of individual ethnographic fieldwork as well as collective reports by KP individuals, 2) cleaned, coded, and disaggregated quantitative data and 3) policy analysis.

RESULTS: Data indicate that KPs in Mauritius are facing marginalization, exclusion, and a lack of resources at a disproportionate rate as compared to the public. Many KPs struggle to access proper existing medical services, address urgent medical needs, and obtain access to lifesaving help due to being barred from existing national social support systems like Social and Disability Aid and various pension systems. Methadone patients are being regularly deprived of their treatment, and national needle and syringe programs (NSPs) have been cut off at lockdown. In addition, due to increased surveillance during the pandemic, there is some evidence of human rights violations as PCs (e.g., sex workers) are being targeted under the law and order efforts by the State, through the Mauritius Police Force and Special Mobile Force (SMF).

CONCLUSIONS: PCs, disproportionately affected by a syndemic of diseases and social conditions, are still being left out of the national health care system in Mauritius due to their existing status as abject bodies. They are perceived as disposable at the hands of the State as sole decider of who is worthy of protection and who can be excluded without recourse. Initial data from the field suggest that KPs in Mauritius may be facing human rights violations at an alarming rate as they are targeted as causes and perpetrators, and in need of stricter policing and surveillance.
